

# Islands in the Asphalt Parking Lot Grading for Commercial Site Projects

Eric Chappell

Author, Consultant, CAD Manager

# Class Summary

In this class we will....

- Explore industry-proven design techniques
- That will result in designs that are
  - More accurate
  - More dynamic
  - More functional
- Experience with site grading would be nice

# Learning Objectives

At the end of this class, you will be able to:

- Use a predefined process to create grading designs that:
  - Are in full 3D
  - Are dynamic
  - Enable design iterations to be applied quickly and easily

# Who Is This Guy?

- Been working in the CAD world for 20 years
  - 4 years in the field
  - 6 years in production
  - 4 years in consulting
  - 6 years in CAD management and consulting
- Author
  - AutoCAD Civil 3D 2012 Essentials
  - AutoCAD Civil 3D Certification Exam
  - Various Autodesk Documents
    - Whitepapers
    - Tutorials
    - Internal Training Materials
- Consultant/Trainer
  - Various Autodesk and non-Autodesk projects
  - AU Instructor for 7 Years

# Introduction

## Successful parking lot grading design requires

- A good conceptual understanding of the process
- Knowledge of key techniques
- Patience
- Ingenuity

# Introduction

**Most grading projects can be boiled down to the following process:**

1. Choosing a grading/drainage scheme
2. Building the grading/drainage scheme
3. Designing the perimeter
4. Checking volumes
5. Adding interior detail
6. Adding driveways

# Introduction

## By using this process you will...

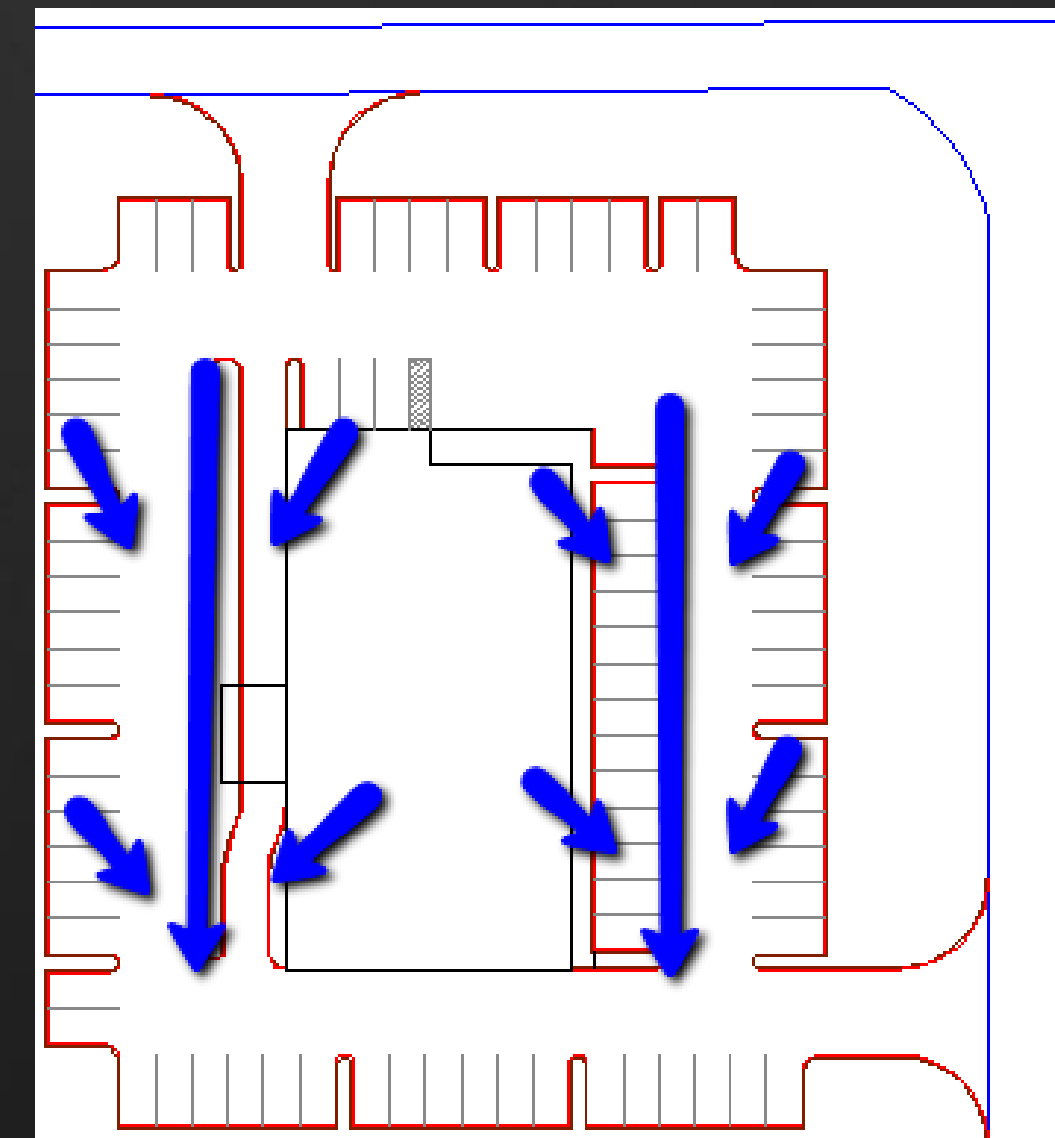

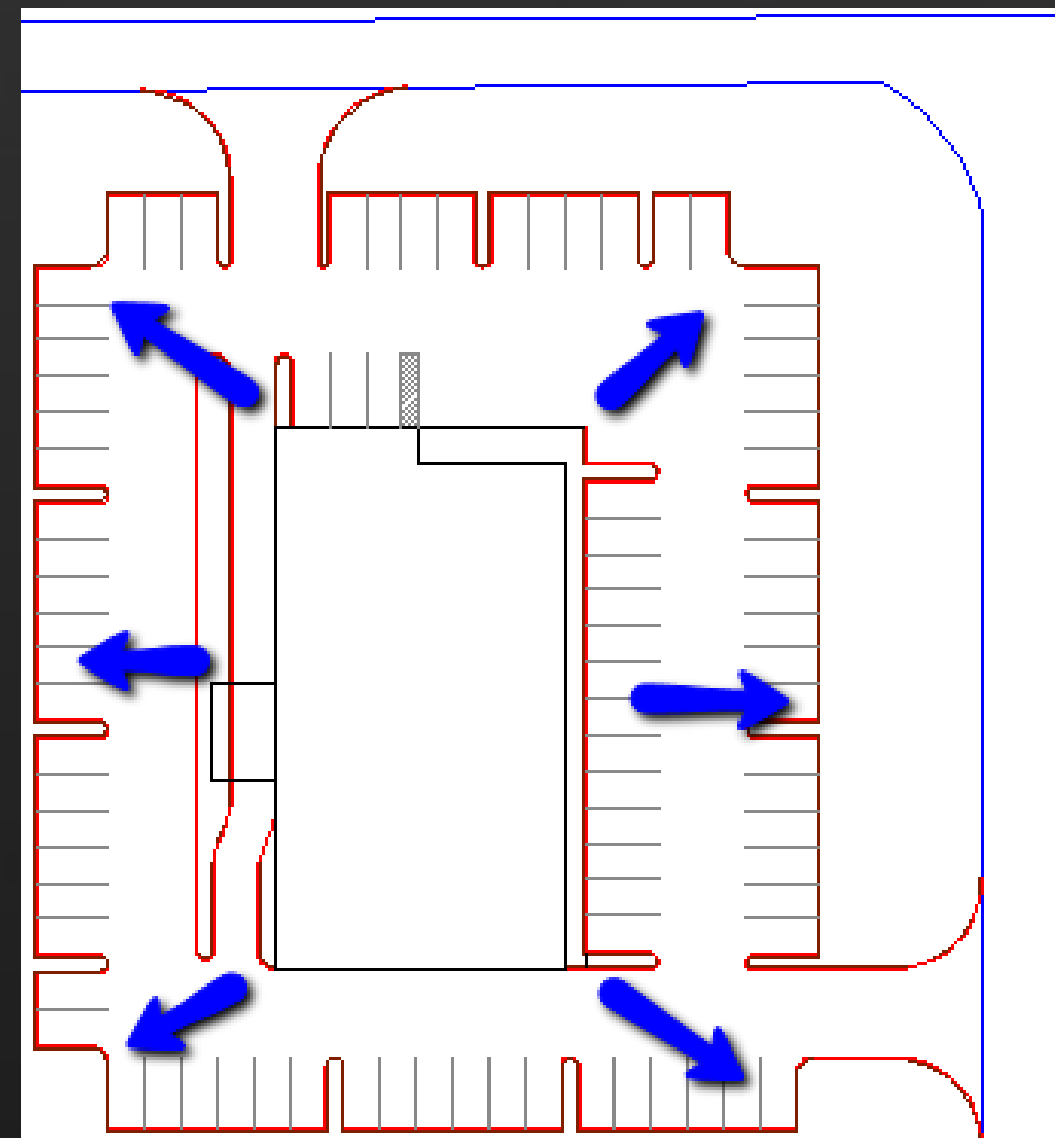

- Take longer to do the initial design
- Create a design that is more easily adjusted when changes arise

...and they will.

# Choosing a Grading/Drainage Scheme

- Before design begins – decide on one or more general grading/drainage schemes

# Building a Grading/Drainage Scheme

- Built quickly with simple geometry
- Ignores layout geometry
- Tools
  - Feature Lines
  - Grading objects
- End Result: *General surface*

# Building a Grading/Drainage Scheme

Let's build some grading/drainage schemes...

# Designing the Perimeter

- Before getting into too much detail – figure out rough perimeter tie-in
  1. Shrink-wrap the layout (ignore driveways)
  2. Assign general surface elevations
  3. Tie in
- Why?
  - Make sure you have room for the layout and grading
    - If a layout change is needed – now's the time to find out
  - Set up rough volume calculations

# Designing the Perimeter

1. Shrink-wrap the surface
  1. Draw a polyline around layout
  2. Offset a little
2. Assign elevations from *general surface*
  1. Convert perimeter to a feature line
  2. Use Elevations from Surface command
3. Tie in
  - Use a Grading object OR
  - Use a tie-in feature line

# Designing the Perimeter

Let's design a few perimeters...

# Checking Volumes

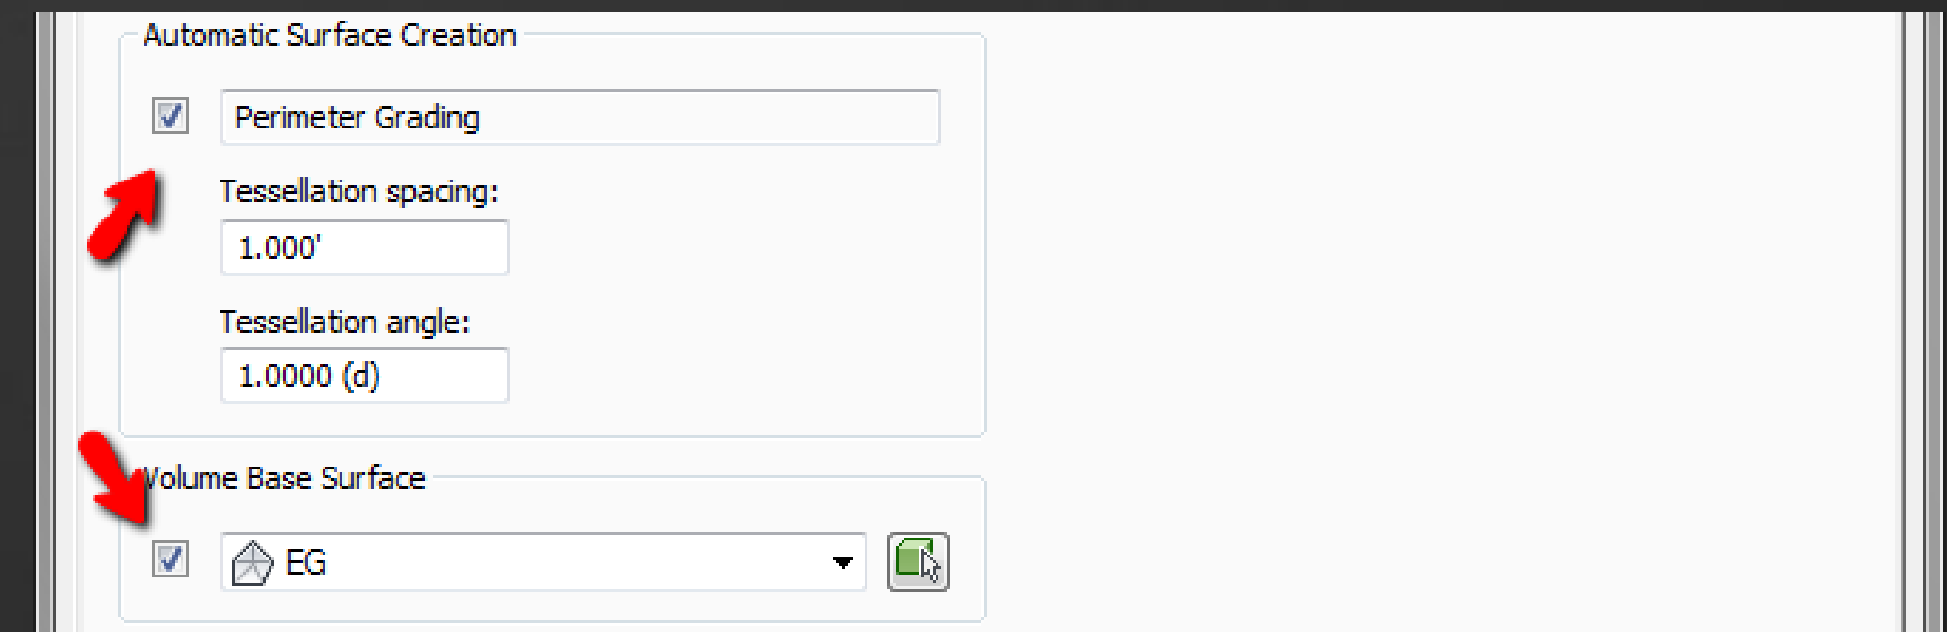

- Now is the time to check the model because:
  1. The design is simple and adjustments are easy
  2. You haven't yet put a ton of time/effort in to the design
- Ways to check volumes
  - If you've used grading objects
    - Use Grading Volume Tools
  - If you cannot use the Grading Volume Tools
    - Volumes command
    - Volume Surface

# Checking Volumes

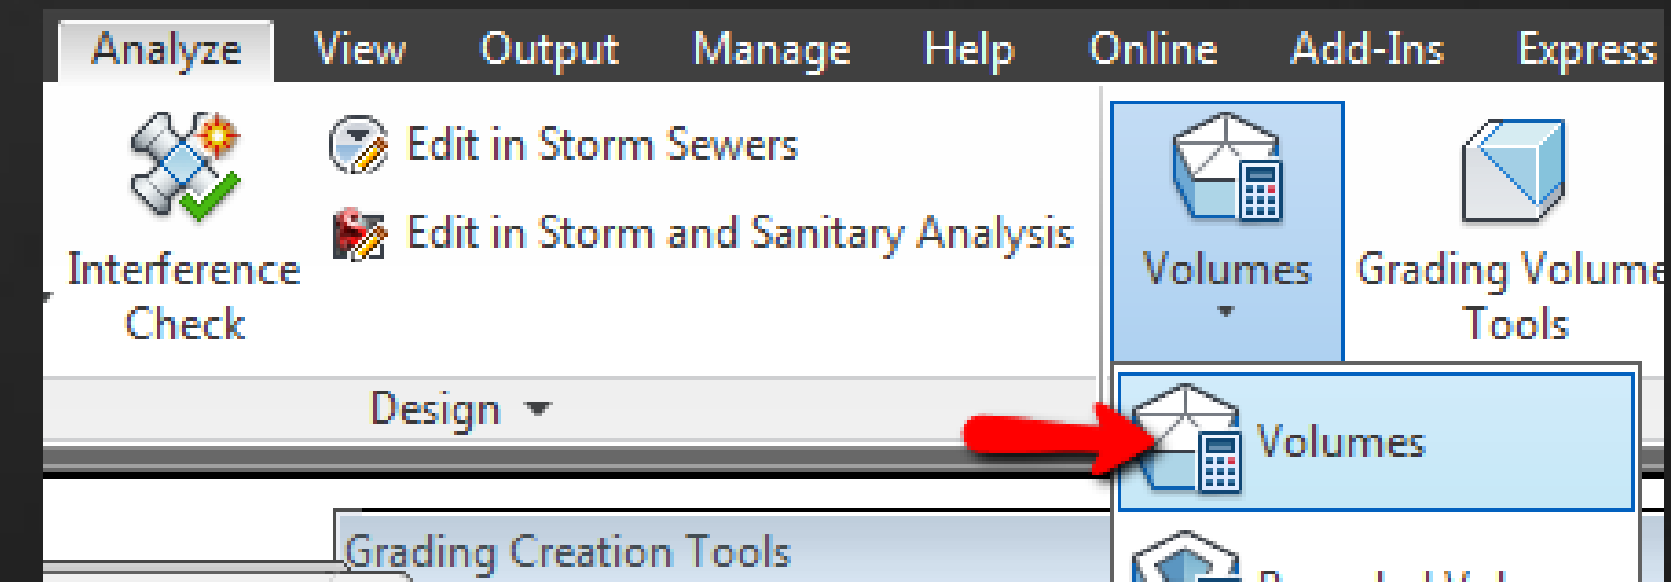

- Grading Volume Tools

1. Add an infill
2. Check Automatic Surface Creation
3. Choose a Volume Base Surface
4. Run the Grading Volume Tools command

- Volumes Command

- Volume Surface

- You may need to adjust your general surface depending on volume results

# Checking Volumes

Let's check some volumes...

# Adding Interior Detail

- Now that...
  - Perimeter design is done...and it works
  - Volume check made and design adjusted if necessary...
- It's time to start adding detail
  - It is important to be patient and wait until now to address detail

# Adding Interior Detail

- To add detail
  - Turn your curbs and edges of pavement into feature lines
    - Use a different site
  - Use Elevations from Surface to project them to your general surface
  - Drop the flow line feature lines to create curb reveal
  - Make minor adjustments if necessary
  - Ignore driveways
  - Build an “interior detail” surface
  - Paste “interior detail” and “perimeter grading” into a third surface

# Adding Interior Detail

Let's add some interior detail...

# Adding Driveways

- Always save driveways for last
- Short, simple driveways can be done with feature lines
- Long, complex driveways can be done with corridors/intersections
- Process
  1. Create a composite EG-FG surface
  2. Draw feature lines that start at EG and end at FG (or alignment/profile/corridor)
  3. Daylight to composite EG-FG surface
  4. Create driveway surfaces and paste into overall surface

# Adding Driveways

Let's add some driveways...

# Review: The Process

**Most grading projects can be boiled down to the following process:**

1. Choosing a grading/drainage scheme
2. Building the grading/drainage scheme
3. Designing the perimeter
4. Checking volumes
5. Adding interior detail
6. Adding driveways

# Key Takeaways

- Modularize your design
  - Grading is complicated
  - Break it down into small, manageable mini-designs
  - Trying to do it all at once is problematic
    - Software limitations
    - Your limitations
  - Easier to manage updates
  - Leverage Civil 3D's dynamic nature
- You will have software issues – get over it.
  - The tools work...most of the time
  - Save often and make backups

# Thank You
