# Class summary

One of the biggest challenges faced by firms today is accessing and managing the multitude of model data generated on a project. Each week the team makes adjustments to the model and its information and you hope to capture those changes and understand how they affect various downstream activities. But even in the age of technology, most model changes are performed by old-fashioned page turns, which is too late and already out of date. Can you quickly and easily find changes between versions of a Revit software model? Can you easily coordinate and identify those changes in your Navisworks coordination model? What is the cost of the change you didn't catch? This in-depth session introduces effective practices for managing Revit model changes in coordination with the various software packages you may be integrating with your Revit model for creating cost estimates, schedules, work breakdown structures, bid packages, and so on. Join us to understand how you can constructively manage for model change.

# Key learning objectives

At the end of this class, you will be able to:

- Learn how to use your model to track model and information changes throughout the project lifecycle.
- Understand effective practices for model use in downstream activities, particularly as progress effects the model and its data.
- Understand how to easily move information between Revit software model iterations in all phases to include design development.
- Learn how to identify solutions for managing external data sets with your Revit software model for greater efficiency in your modeling activities.

# Introductions

John Grady

Matt Edwards

Nancy Clark Brown

# Agenda

- Review best practices for setting up a model in anticipation of change
- Introduce workflows for managing model changes
- Review CRB case studies

# The “I” in BIM

- > A building information model, if used most effectively, is a robust database of information that is flexible, adaptable, searchable and extensible
- > The information should be managed with the same care as the geometry
- > Managing a few key parameters can significantly increase the use of the model, model communication, quality and **ESPECIALLY** for change management

# The “I” in BIM

The “I” in BIM has not been fully realized, for a few key reasons:

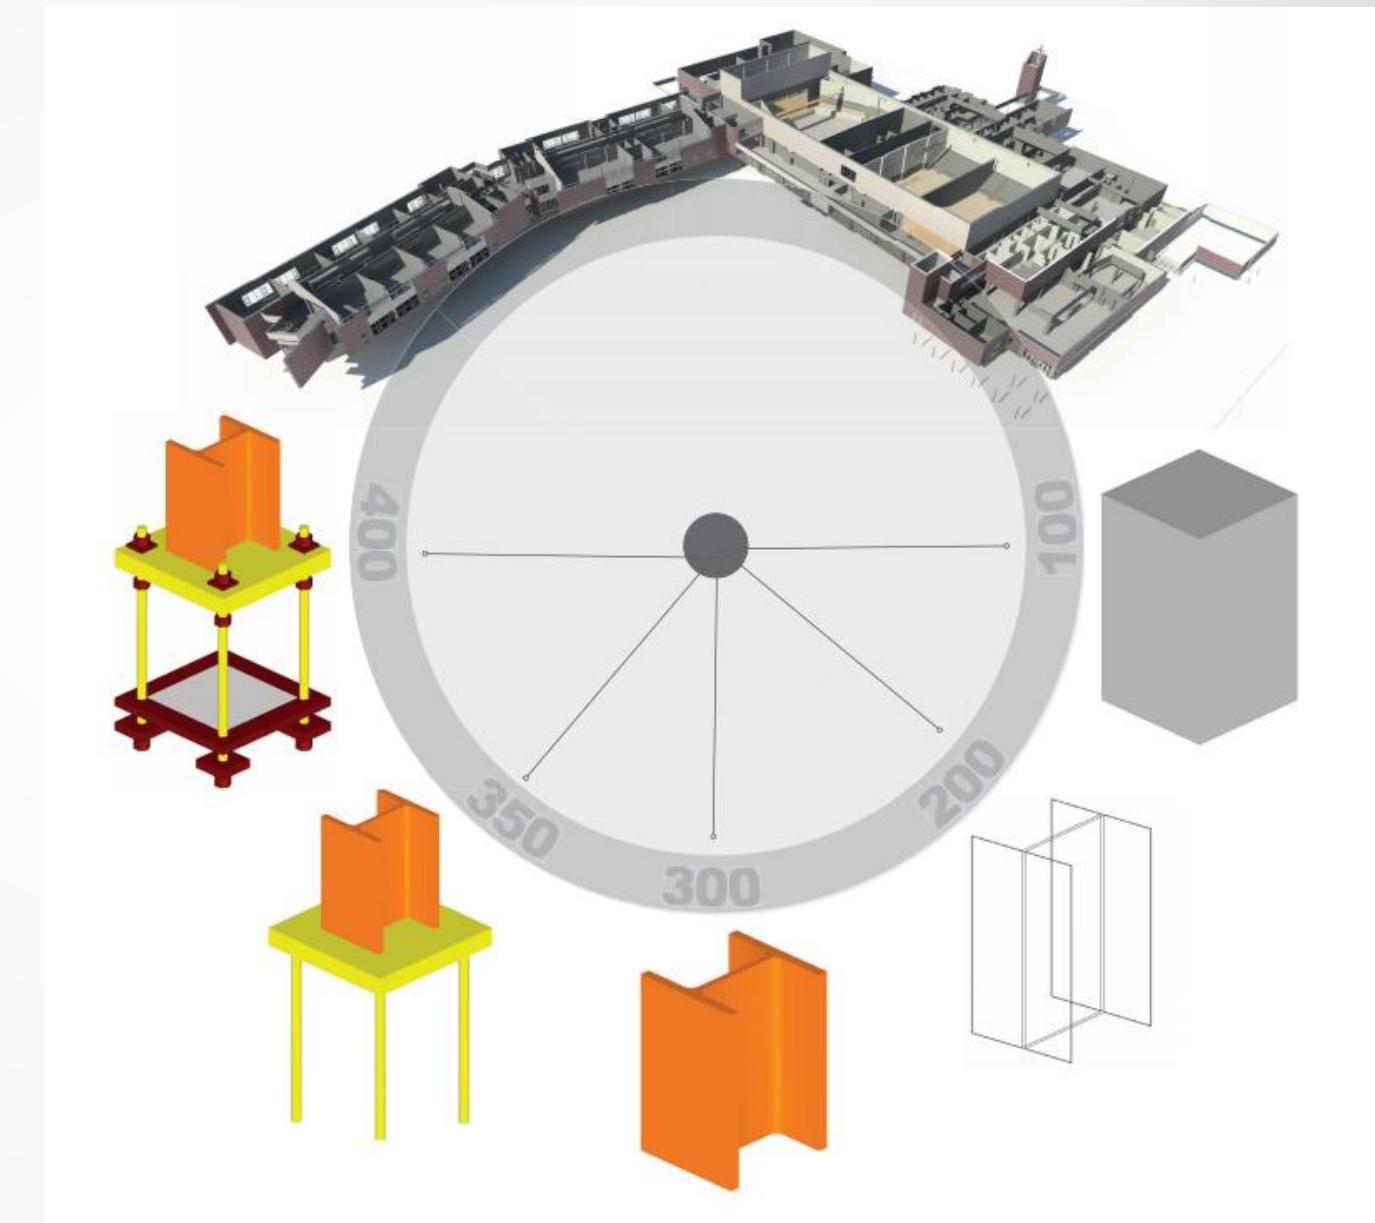

- > Difficulty in accessing and managing the “I”
- > Interoperability of the “I”
- > Limited number of people and roles with access to the “I”

# Key Aspects of Managing Model Change

- > Version Control
  - Regular record of model development or baseline model
- > Parameter Conditioning
  - Identification of model properties for tracking model development and model change (for downstream activities)
- > Change Reporting & Documentation
  - Fast, effective reporting for insight into the scope of change and communication of the change

# Parameters for Communication

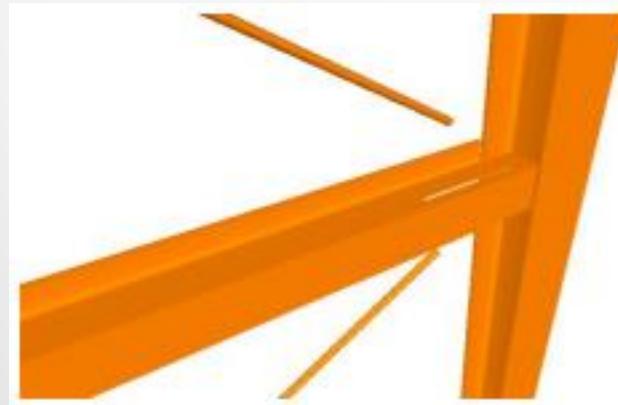

- > Level of Development
- > Assembly Codes
- > Naming Conventions
- > Other Parameters

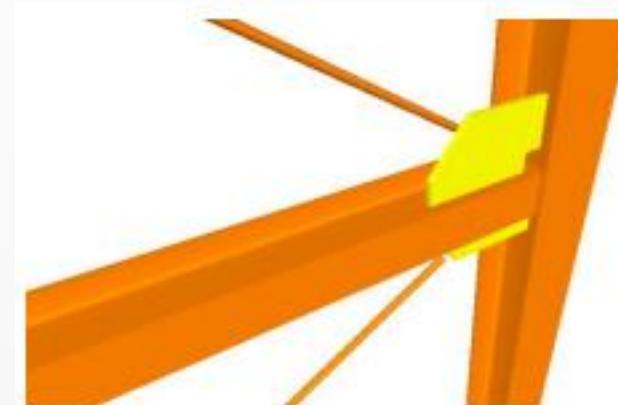

<http://bimforum.org/wp-content/uploads/2013/08/2013-LOD-Specification.pdf>

# Level of Development

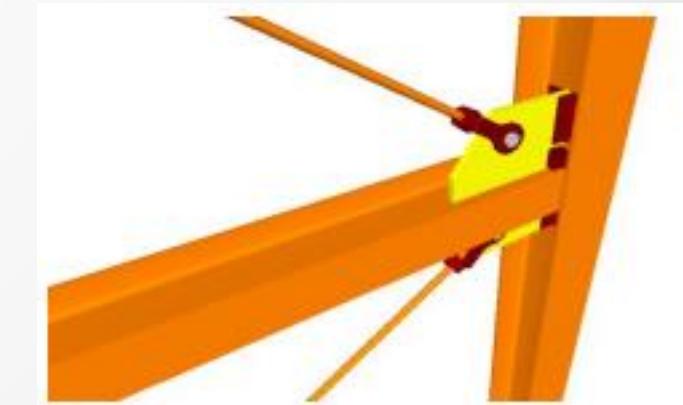

- > LOD is a clear way of communicating which objects *CAN* be used for downstream activities and which objects *CANNOT*
- > Level of Development is about information *NOT* just detail

LOD 300

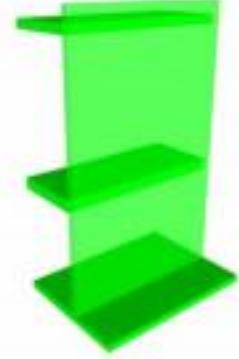

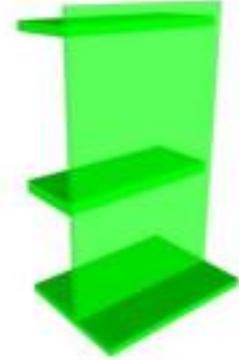

LOD 350

LOD 400

## B2010 – Exterior Walls

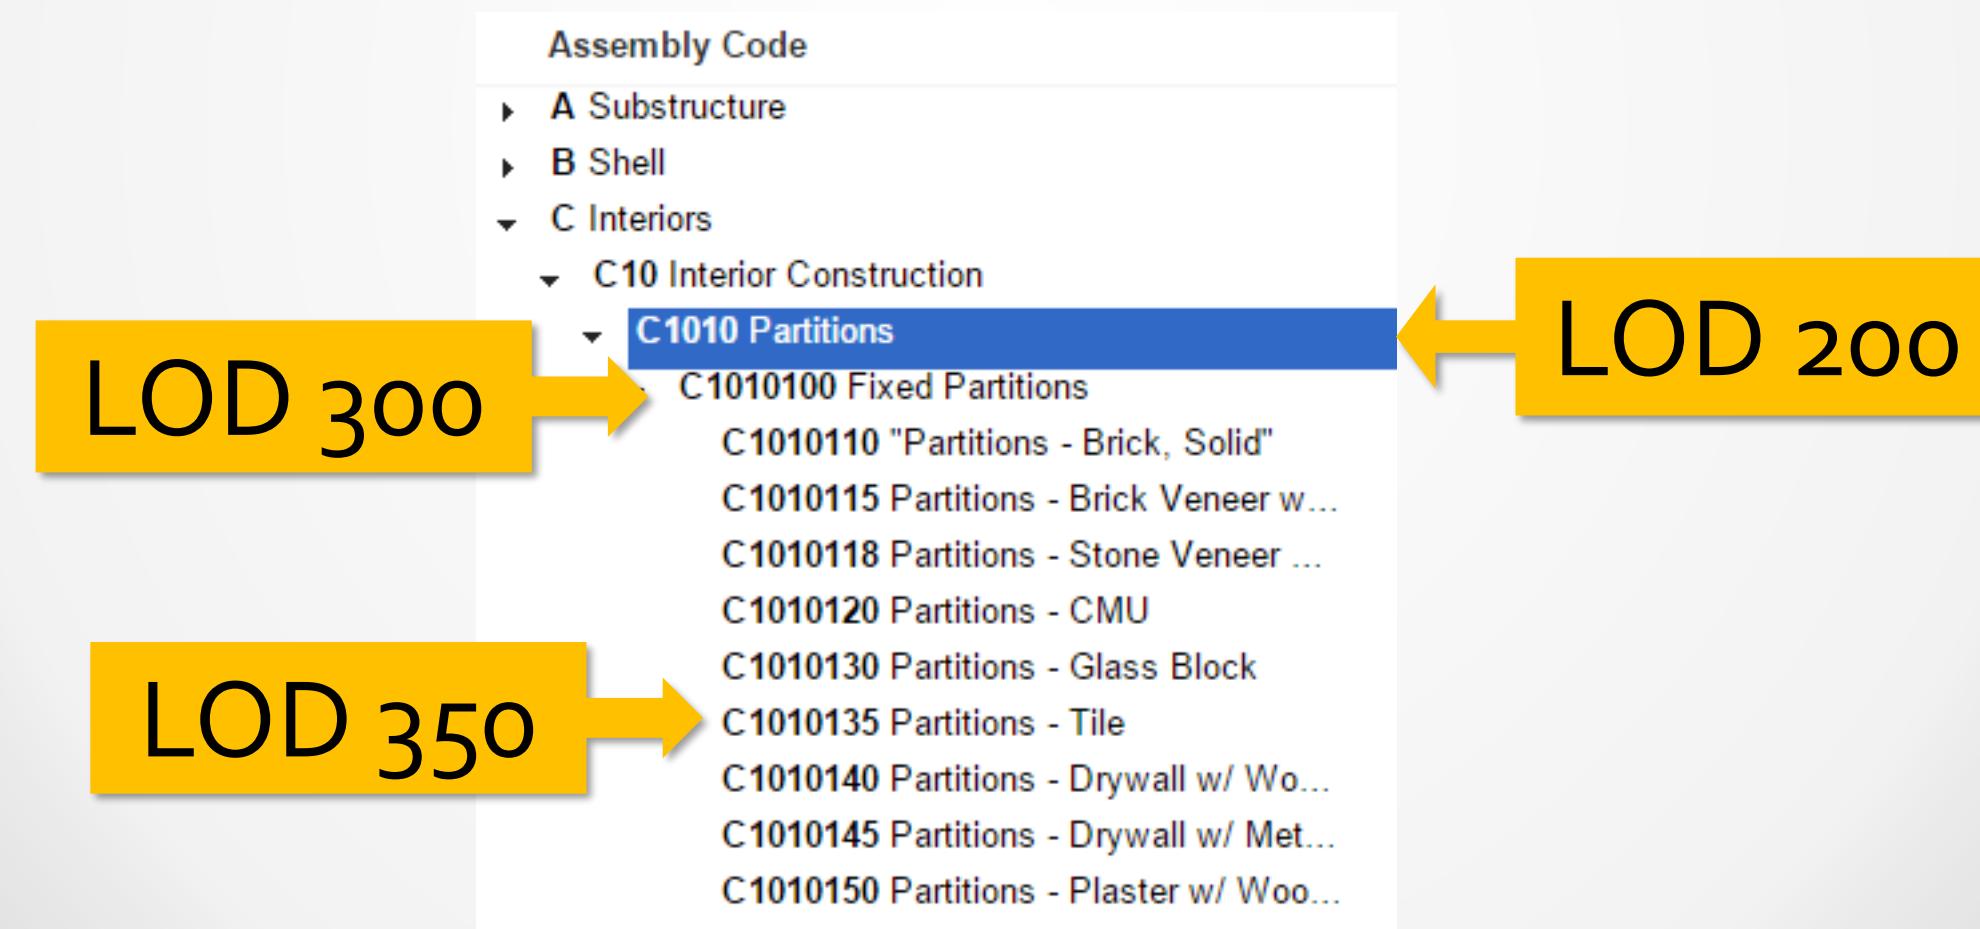

*Solid wall construction that is composite in nature; in other words, multiple layers of materials to form an overall assembly.*

100	See <a href="#">B20</a>	
200	<p>Generic wall objects separated by type of material (e.g. brick wall vs. terracotta).</p> <p>Approximate overall wall thickness represented by a single assembly.</p> <p>Layouts and locations still flexible.</p>	
300	<p>Composite model assembly with specific overall thickness that accounts for veneer, structure, insulation, air space, and interior skin specified for the wall system. (Refer to LOD350 and LOD400 for individually modeled elements)</p> <p>Penetrations are modeled to nominal dimensions for major wall openings such as windows, doors, and large mechanical elements.</p> <p>Required non-graphic information associated with model elements includes:</p> <ul style="list-style-type: none"><li>• Wall type</li><li>• Materials</li></ul>	
350	<p>A composite wall assembly may be considered for LOD350 only if hosted objects such as windows and doors are provided at a minimum of LOD350.</p> <p>Main structural members such as headers and jambs at openings are modeled within the composite assembly.</p>	

<http://bimforum.org/wp-content/uploads/2013/08/2013-LOD-Specification.pdf>, pg 36

# Assembly Codes

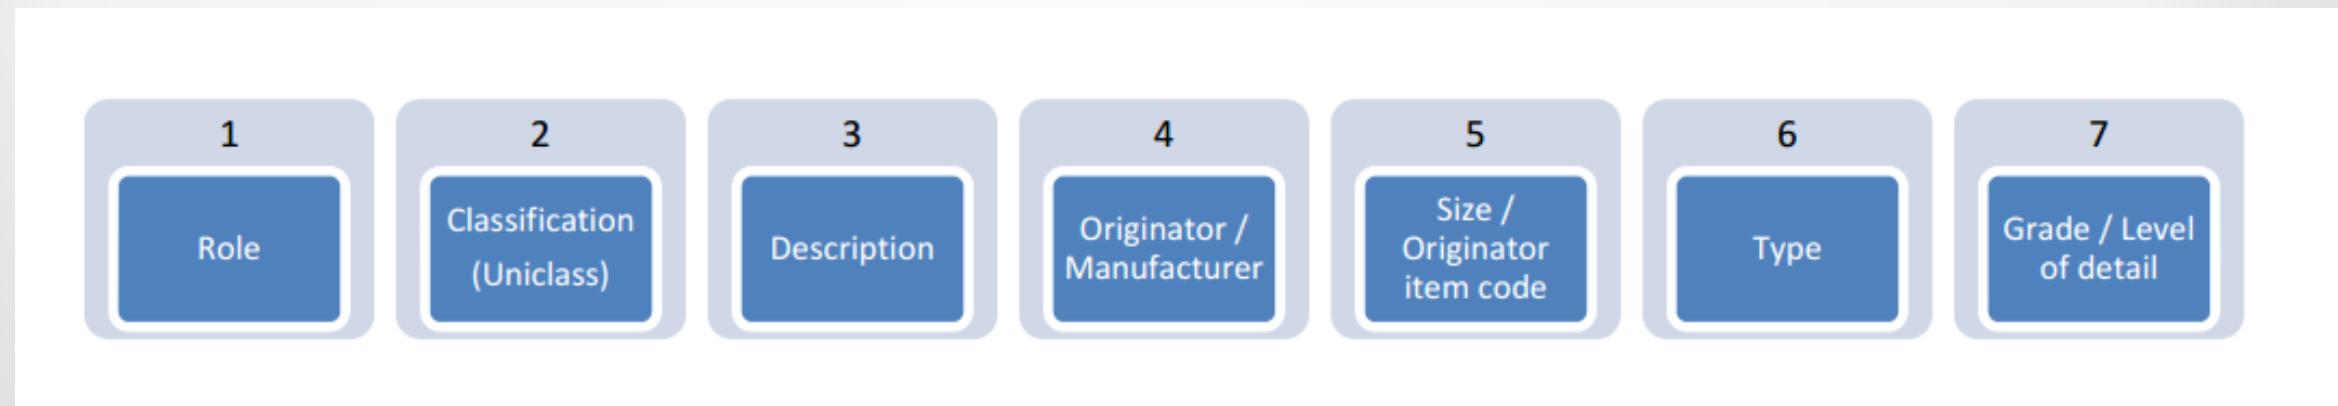

- > Coding schemes can serve as a way to further clarify the definition of a component beyond the geometry

<http://www.csinet.org/Home-Page-Category/Formats/UniFormat>

# Naming Conventions/Standards

- > Communicates the status of the object/assembly development (generic vs. specified)
- > Clarifies use (fire rating, function, classification, etc)
- > Denotes size
- > Does not provide redundant information

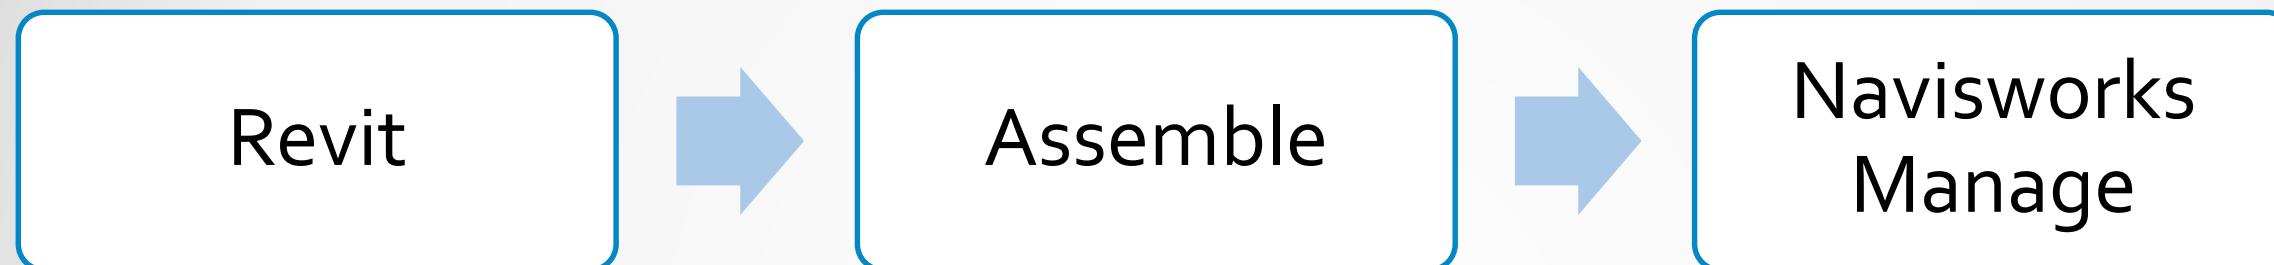

<http://aecuk.files.wordpress.com/2012/09/aecukbimprotocol-v2-0.pdf>

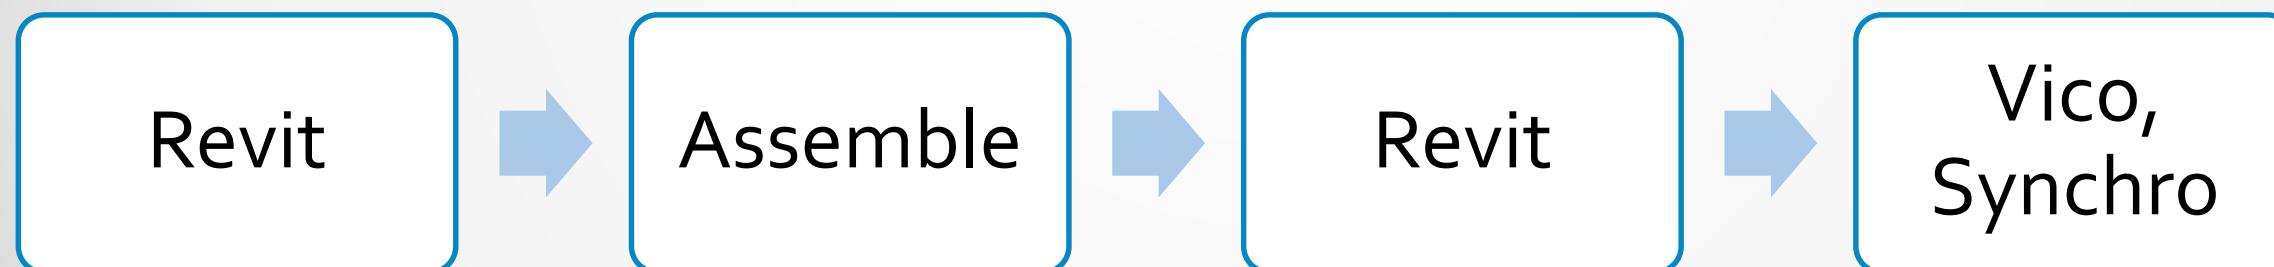

pg 35

# Workflows for Managing Model Change

## > For Coordination Model Workflow

## > For Downstream Estimating/Scheduling Workflow

# Assembling your Revit model and Changing the “I” in BIM

- > Anyone can add information to the model
- > Maintain information inside or outside of a model, even as the model develops
- > Flexibility to share information with others in a variety of formats
- > Fast, searchable information for quick answers and decision making
- > Robust, high quality, accurate BIM deliverable in less time
- > Ability to expand your services

# Workflow Demonstration

See class handout for detailed information on how to practice workflows outside of class.
