

Prototype Machining for Product Designers with Autodesk Fusion 360®

Andrew Grevstad

Tormach Inc.

@tormach

Class summary

Affordable tools from Autodesk and Tormach are helping product designers use CNC milling technology to improve designs, test market products, and reduce lead times.

- Case studies of successful CNC milling in product design
- Discussion of important CNC milling concepts for designers
- Demo of Autodesk Fusion 360® and Tormach PCNC 440 milling machine

Key learning objectives

At the end of this class, you will be able to:

- List advantages of CNC machining for prototyping
- Describe CAD/CAM workflow for designing and machining parts
- Understand essential CNC milling concepts
- Design simple tool path strategies using Autodesk Fusion 360®

Introduction

CNC for Product Design

- Affordable
- Accessible
- Easy-to-Use
- Makes Real Parts

Advantages of In-House CNC Machining for Prototyping and Product Design

Functional Prototypes

- Function vs. Form
- Real Materials
 - Steel
 - Aluminum
 - Stainless Steel
 - Titanium
 - Engineering Plastics
 - Fiber and Layered Composites
 - Wood

UNDERWATER AUTONOMOUS VEHICLE PROPULSION UNIT. CNC MACHINED PROPELLER AND MOTOR HOUSING MADE WITH TORMACH PCNC 1100® MILL AND 15L SLANT-PRO™ CNC LATHE. 3D PRINTED FAN COWLING.

Functional Prototypes

- Mechanical Assemblies
 - Frames and Structural Components
 - Gears / Cogs / Pulleys
 - Thread connections
 - Shafts / Rotors
 - Bearing Blocks
 - Motor Mounts
 - Heat sinks
 - Valve Bodies

HUBO+ HUMANOID LEG ASSEMBLY BY DREXEL AUTONOMOUS SYSTEMS LABORATORY (DASL). MADE WITH TORMACH PCNC 1100®.

Functional Prototypes

- Additive materials do not have well established design standards.
- Mechanical, heat transfer, optical, etc., properties can be different from bulk material
 - Layer thickness
 - Layer orientation
 - Filament or powder characteristics
 - Machine specific manufacturing methods

MICROFLUIDIC DEVICE MACHINED FROM ACRYLIC PLASTIC ON TORMACH PCNC 770®. PHOTO CREDIT: EDMOND YOUNG, UNIVERSITY OF TORONTO

Test Marketing

- Create “Product Quality” prototypes
- Test market before committing to expensive production tooling
- Scale up from prototype to short run production – “Bootstrap Manufacturing”

MARSHMALLOW BLASTER PROTOTYPE MADE FOR TEST MARKETING AT NY TOY FAIR. RIGID PLASTIC PARTS AND SHORT RUN ALUMINUM INJECTION MOLDS MADE ON TORMACH PCNC 1100.

Test Marketing

- Rapid Iteration
- Design Refinement
- Compress Design Cycle
- Reduce prototype costs

STEEL DIES FOR YOGURT
CUP PROTOTYPED ON
TORMACH PCNC 1100
BEFORE COMMITTING TO
PRODUCTION TOOLING

Customization and Personalization

- One size does not fit all
- Parametric CAD/CAM in Autodesk Fusion 360 can adjust tool paths in parallel with design modifications
 - Serial numbers
 - Different sizes

PERSONALIZED SUNGLASSES BY INDIVIDJUAL EYEWARE
MADE ON TORMACH PCNC 770.

Product Variants and On-Demand Manufacturing

- Autodesk Fusion 360 can easily adapt to product variants
- Reduce overhead and inventory
- Fulfill on demand

TITANIUM SCREWS AND PLASTIC SPACERS FOR SPINAL IMPLANT SURGERY MADE BY EISERTECH ON TORMACH PCNC 770.

CAD/CAM Workflow and Machining Process Design

Design for Machining

“Think like a Machinist”

- Minimize setups
- Minimize tools
- Don't design things that can't be machined
- Sequence of Operations

It all starts with
WORKHOLDING

Workholding: Flip and Deck

- Naturally adapts to vise work
- Machine majority of part from one side, then flip to deck the part

Workholding: Picture Frame

- Effective for complicated shapes
- Needs a secondary finishing operation to remove tabs

Workholding: Fixture Plates

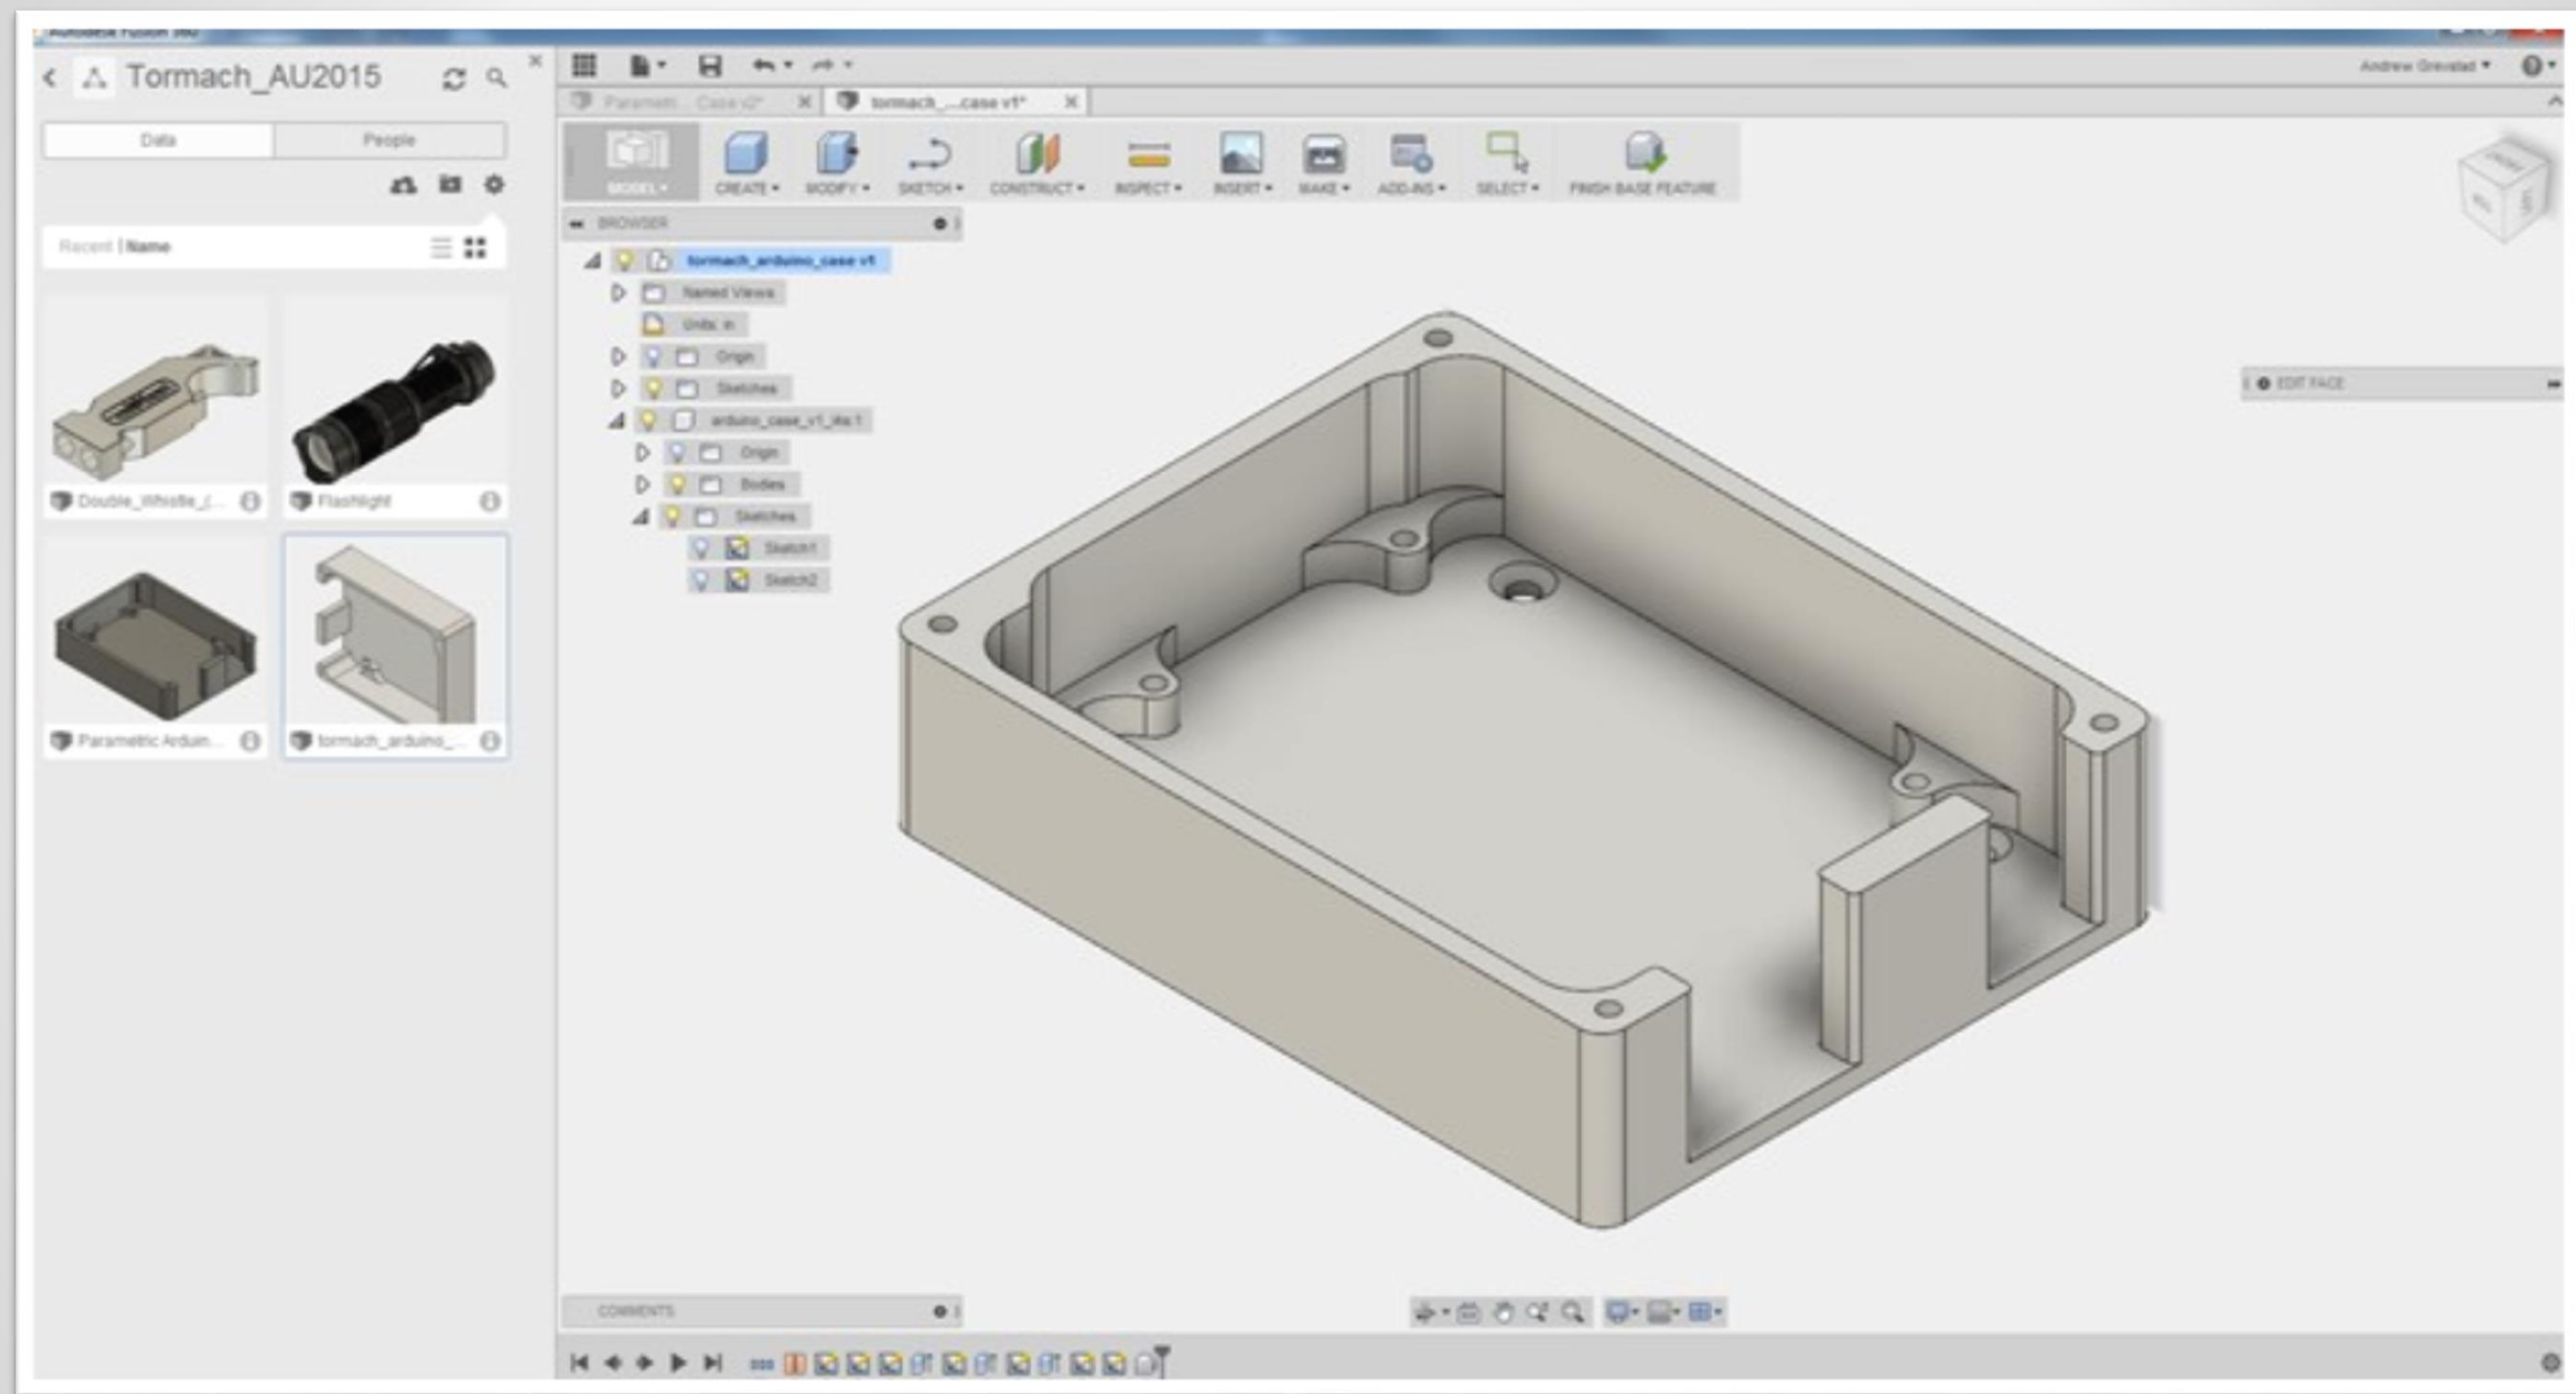

- Large Parts and Thin Parts
- Can you use Existing Holes?
 - If not, where can you add holes without interfering with part function?
- Clamps must be repositioned?

Workholding: Collet Fixtures

- Round, hex and square parts
- End work
- V-blocks, V-Jaws, and Table Chucks can also be used in a similar way

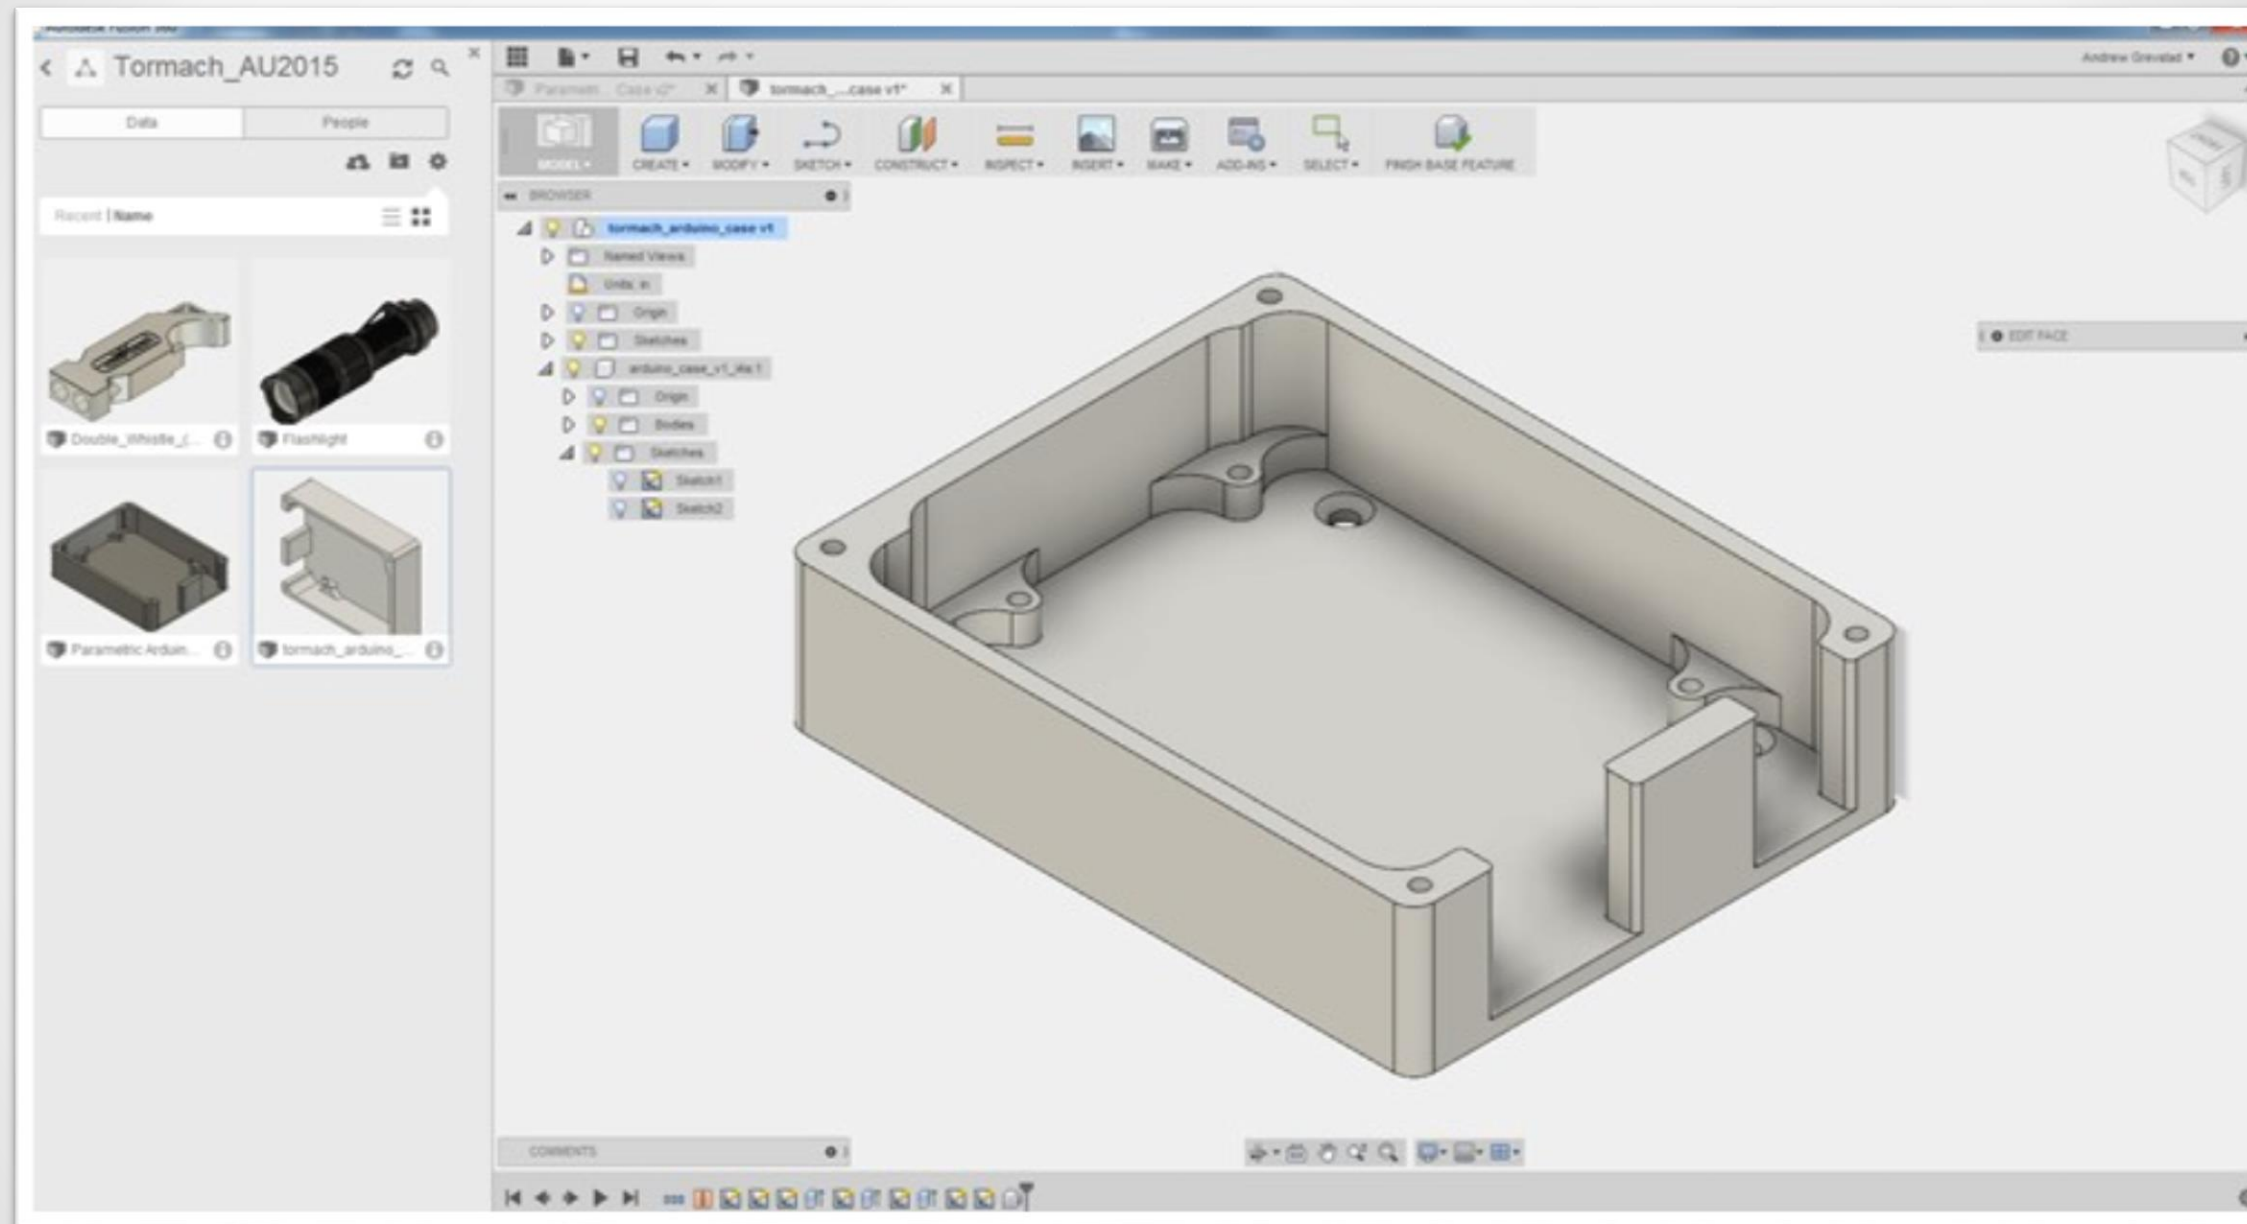

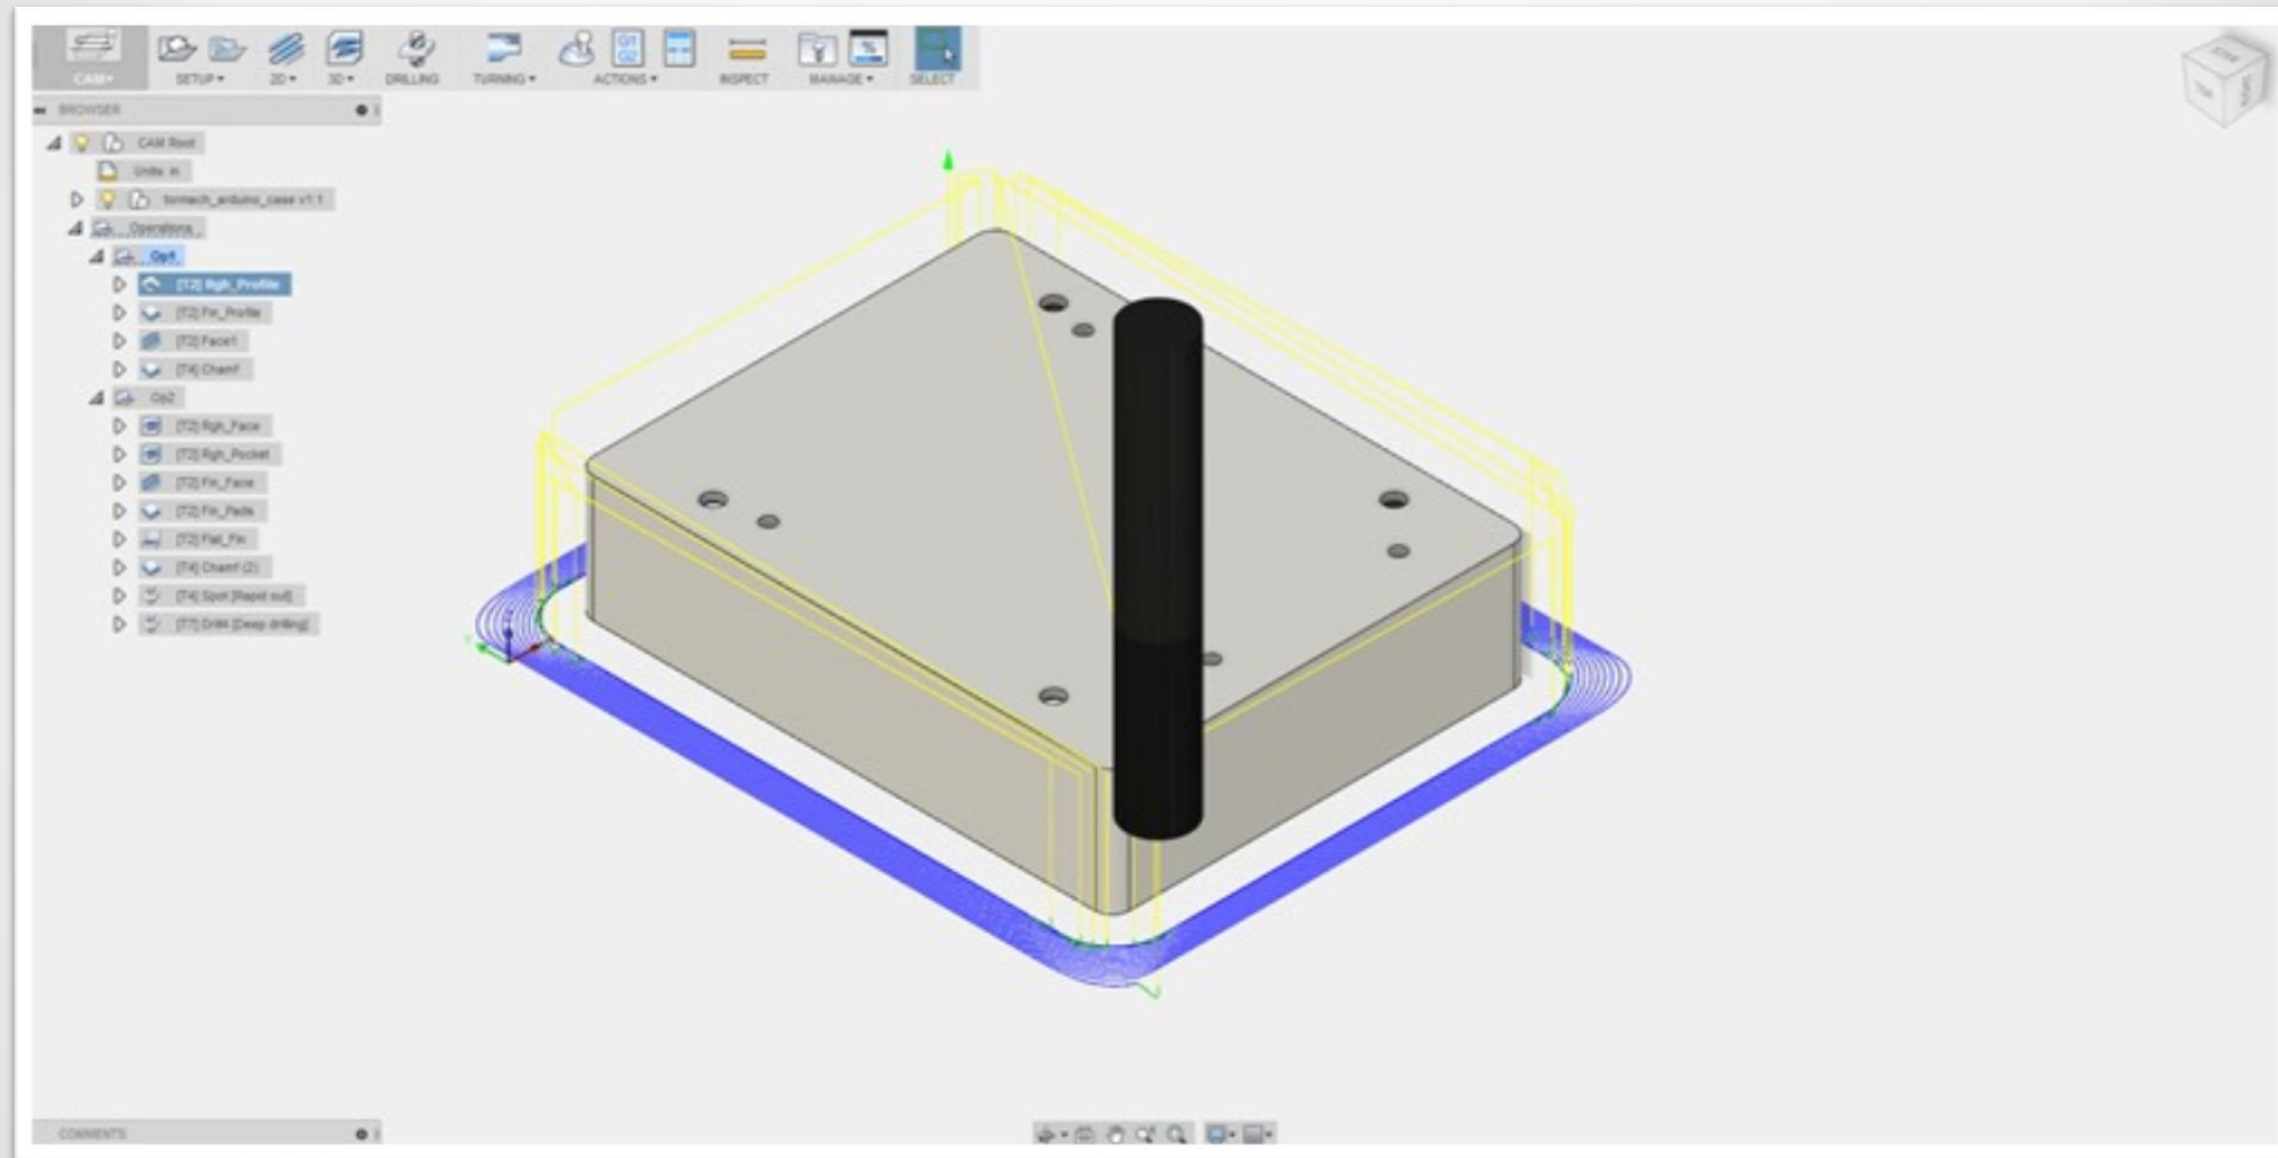

CNC Workflow Cheat Sheet

- Evaluate design for machining (DFM)
 - Which tools to use?
 - Workholding!
- Figure out the sequence
 - How many operations?
 - How many strategies?
- Setup the project in CAM
 - Orientation
 - Work Offset
 - How much modeling is needed? Vise, Machine, Toolholders, Fixtures?
- Design tool paths
 - Get the geometry right first
 - Then fill in the details (Feeds, Speeds, Depth of Cut, Width of Cut)
- Simulate

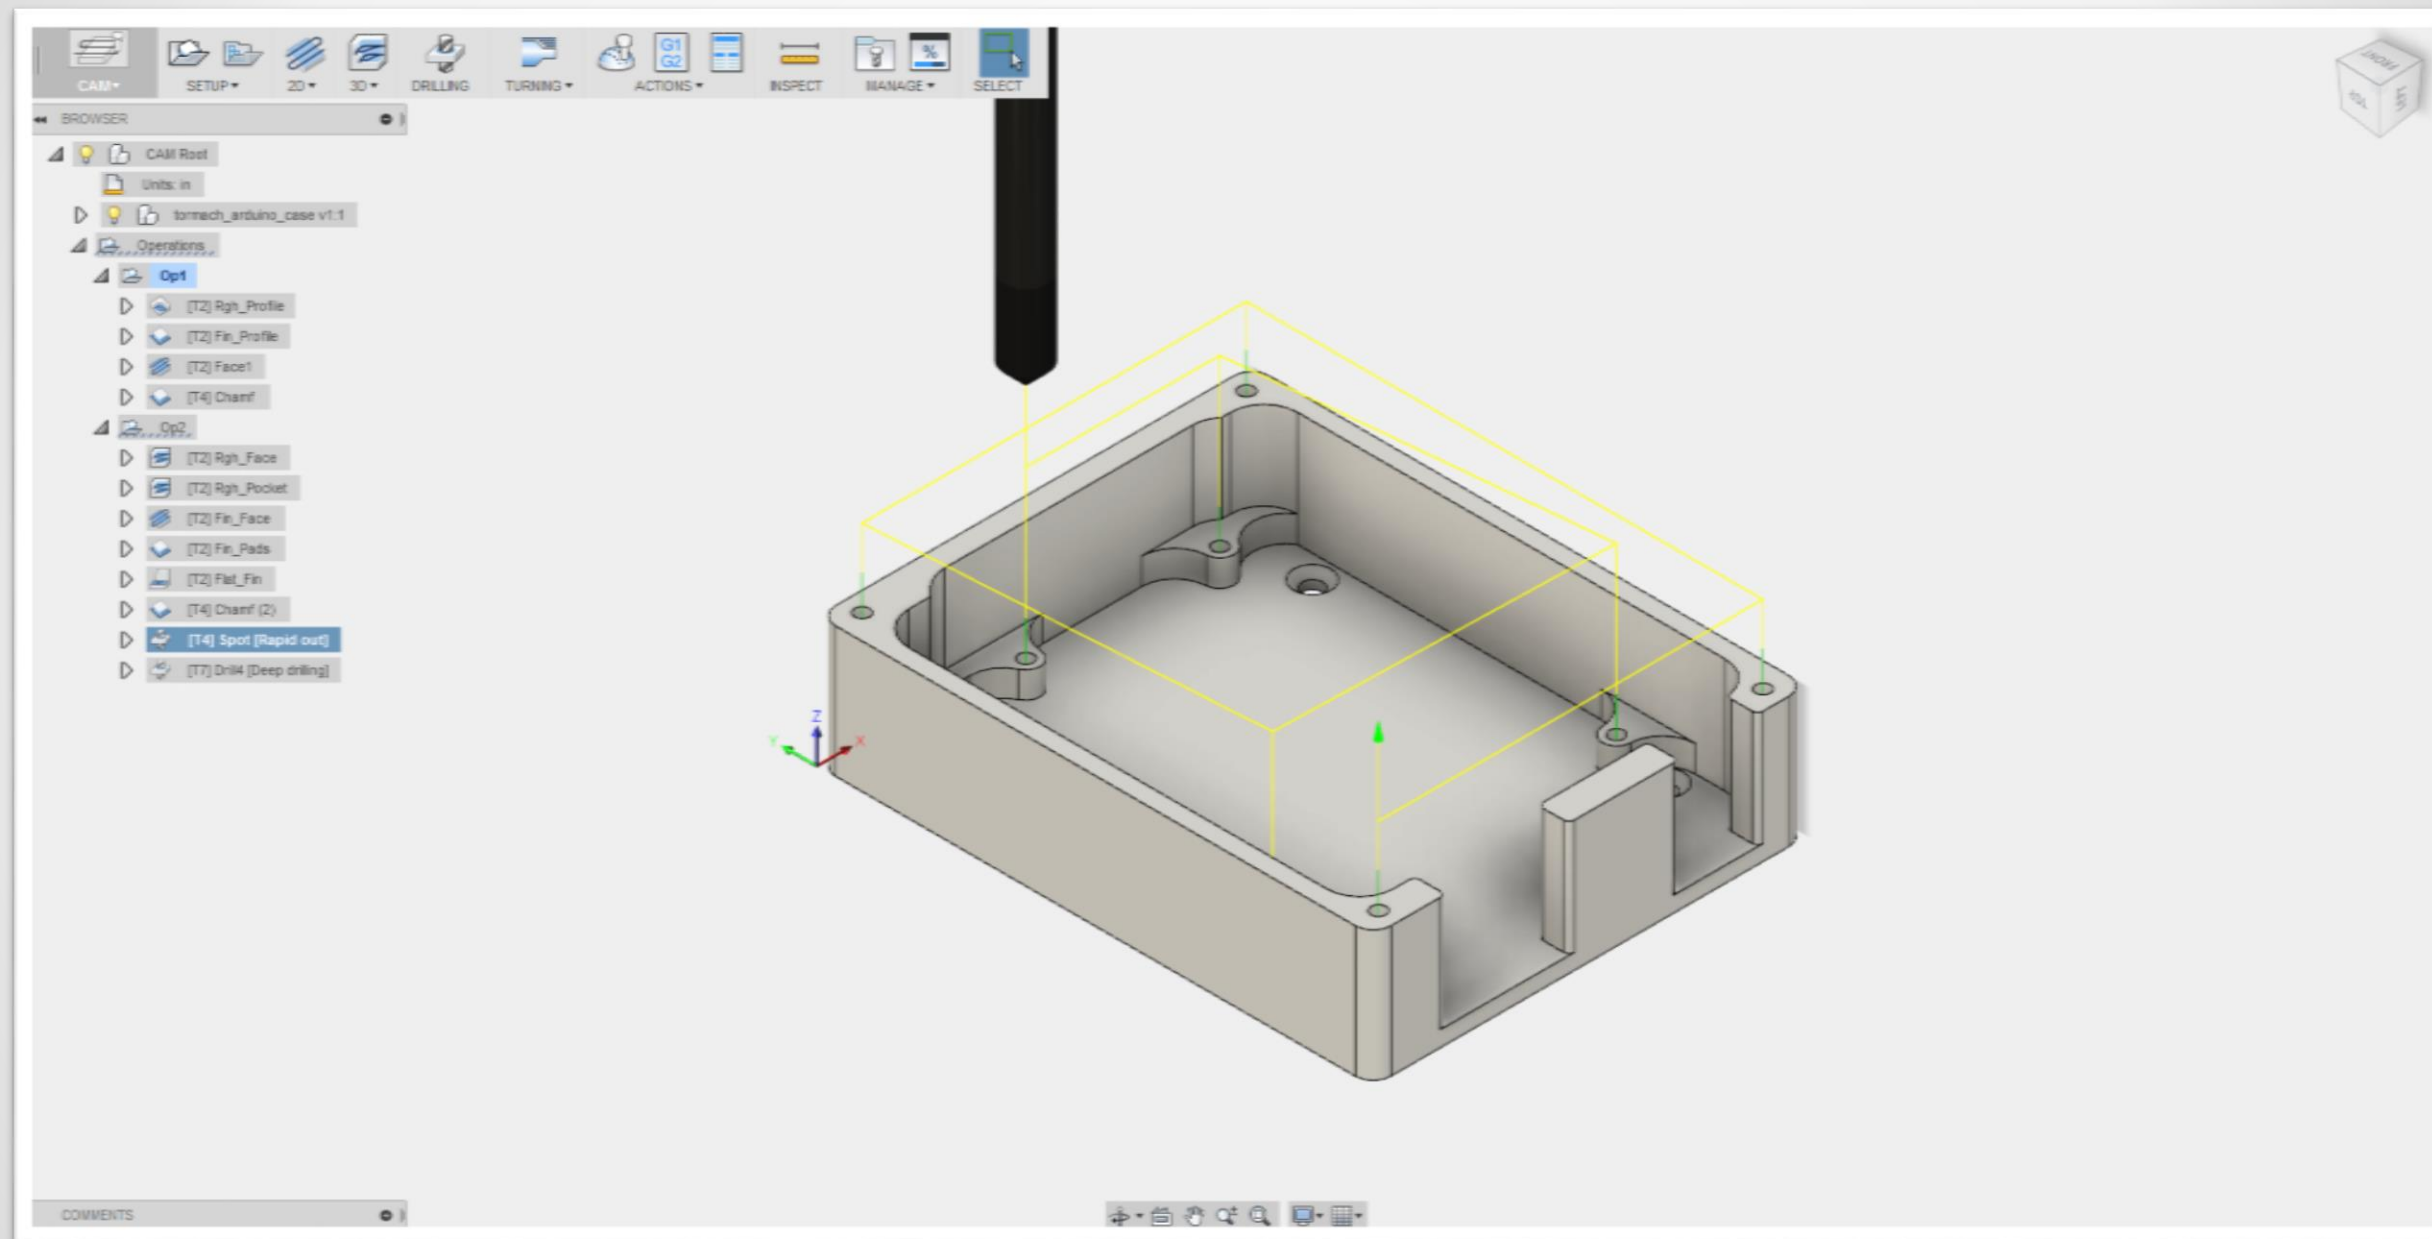

Orient and Locate in CAM

Design Tool Paths

Simulate

Technique in Action
