With special interest in Automation including
Scripting and REST API

REVISION CONTROL, EFFECTIVITY, AND CHANGE MANAGEMENT

Class summary

Learn how to implement configuration management and release processes in Autodesk PLM 360 cloud-based product lifecycle management software. The class covers the concepts of change management and effectivity. We demonstrate the basic workflows and concepts.

Class Flow

- Introductions and Administration
- What is Configuration Management
- Items, Revisions, and Effectivity
- BOMs, BOM Relationships, and BOM Configuration
- Change Management and Change Impact Assessment
- Q&A

Confidentiality

- **Today's discussion is covered under the non-disclosure section of the Autodesk Participation Agreement.**
- **The information we will be sharing is highly confidential, and is to be shared within your company on “need to know basis” and to no one outside your company.**

No Reliance

- Autodesk makes no guarantees that anything presented or discussed today will actually appear in the future.
- *We may make statements regarding planned or future development efforts for our existing or new products and services. These statements are not intended to be a promise or guarantee of future availability of products, services or features but merely reflect our current plans and based on factors currently known to us. These planned and future development efforts may change without notice. Purchasing decisions should not be made based upon reliance on these statements.*
- *These statements are being made as of today and we assume no obligation to update these forward-looking statements to reflect events that occur or circumstances that exist or change after the date on which they were made. If this presentation is reviewed after today, these statements may no longer contain current or accurate information.*

What Is Configuration Management

A Little History

- CM was first introduced by the Air Force in 1962 as means to ensure
 - Documentation delivered with product matched the product delivered
 - Ability of suppliers to create additional identical products
- Concepts of CM were widely adopted by industry and are at the core of SE, CMMI, ITIL, ISO 9000 and other
 - Military standard replaced in 1994 by 'best commercial practices'
 - ANSI GEIA-STD-649 is the DoD sponsored alternative
- CMII refers to the Institute of Configuration Management (ICM) 'The Path to Integrated Process Excellence'

Find the Differences!

Configuration management

From Wikipedia, the free encyclopedia

This article is about the broad systems engineering process. For the specific ITIL process, see [Configuration Management \(ITSM\)](#).

Configuration management (CM) is a systems engineering process for establishing and maintaining consistency of a product's performance, functional and physical attributes with its requirements, design and operational information throughout its life.^{[1][2]} The CM process is widely used by military engineering organizations to manage complex systems, such as weapon systems, vehicles, and information systems. Outside the military, the CM process is also used with IT service management as defined by ITIL, resp. ISO/IEC 20000, and with other domain models in the civil engineering and other industrial engineering segments such as roads, bridges, canals, dams, and buildings.^{[3][4][5]}

Overview [\[edit source\]](#)

CM is the practice of handling changes systematically so that a system maintains its integrity over time. CM implements the policies, procedures, techniques, and tools that are required to manage, evaluate proposed changes, track the status of changes, and to maintain an inventory of system and support documents as the system changes. CM programs and plans provide technical and administrative direction to the development and implementation of the procedures, functions, services, tools, processes, and resources required to successfully develop and support a complex system. During system development, CM allows program management to track requirements throughout the life cycle through acceptance and operations and maintenance. As changes are inevitably made to the requirements and design, they must be approved and documented, creating an accurate record of the system status. Ideally the CM process is applied throughout the system lifecycle.

Changes (To Your BOM) Occur Constantly

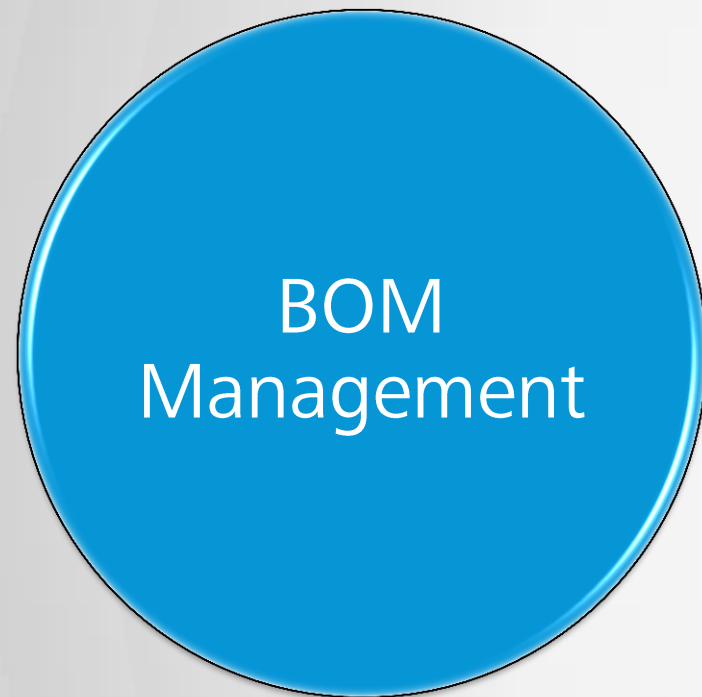

- Availability of components or raw materials
- Incorporate warranty and field learning
- Need to diversify supply chains due to capacity, quality, location, or other constraints
- Cost reduction initiatives

It is virtually impossible to make identical products over long durations of time

CM Common Questions

- How did this item change over time?
- What did it look like last week? What will it look like in 2 weeks?
- What did we build for this customer last time?
- If we wanted to build another one of those, what would it look like today?

Get Changes Under Control

Items, Revisions, and Effectivity

Items Go Through Changes

- When item is 'Ready', an Item Revision is 'locked'
 - Ready for review
 - Ready for prototype
 - Ready for production

Revisions, rather than a new PN, usually require no change in Form, Fit, or Function

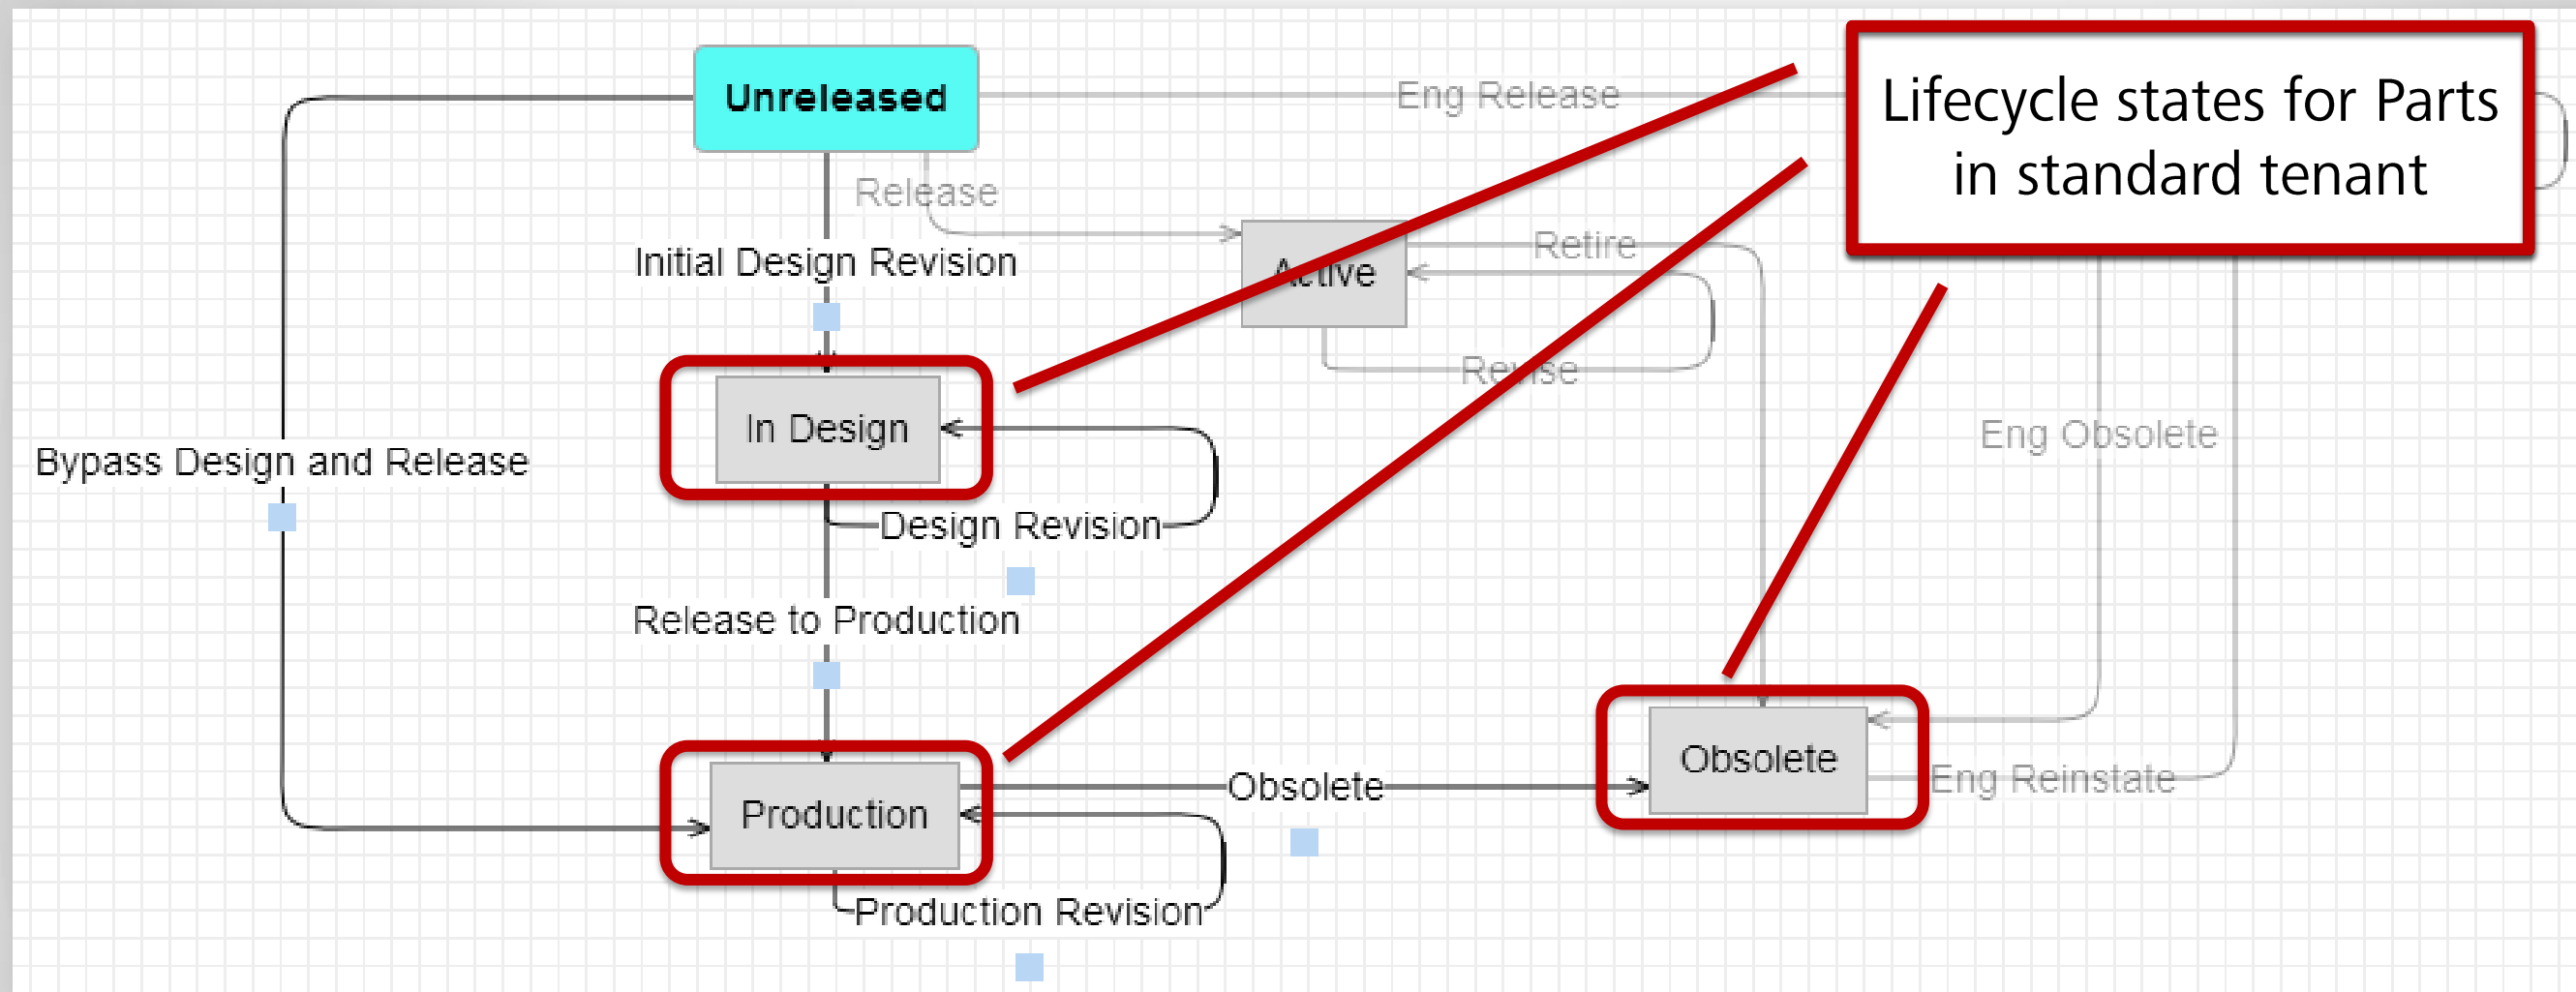

Item / Part Number

Rev A

Rev B

Rev C

'Readiness' Captured In Lifecycle States

Lifecycle States may represent Maturity or Gateway Readiness

Item / Part Number

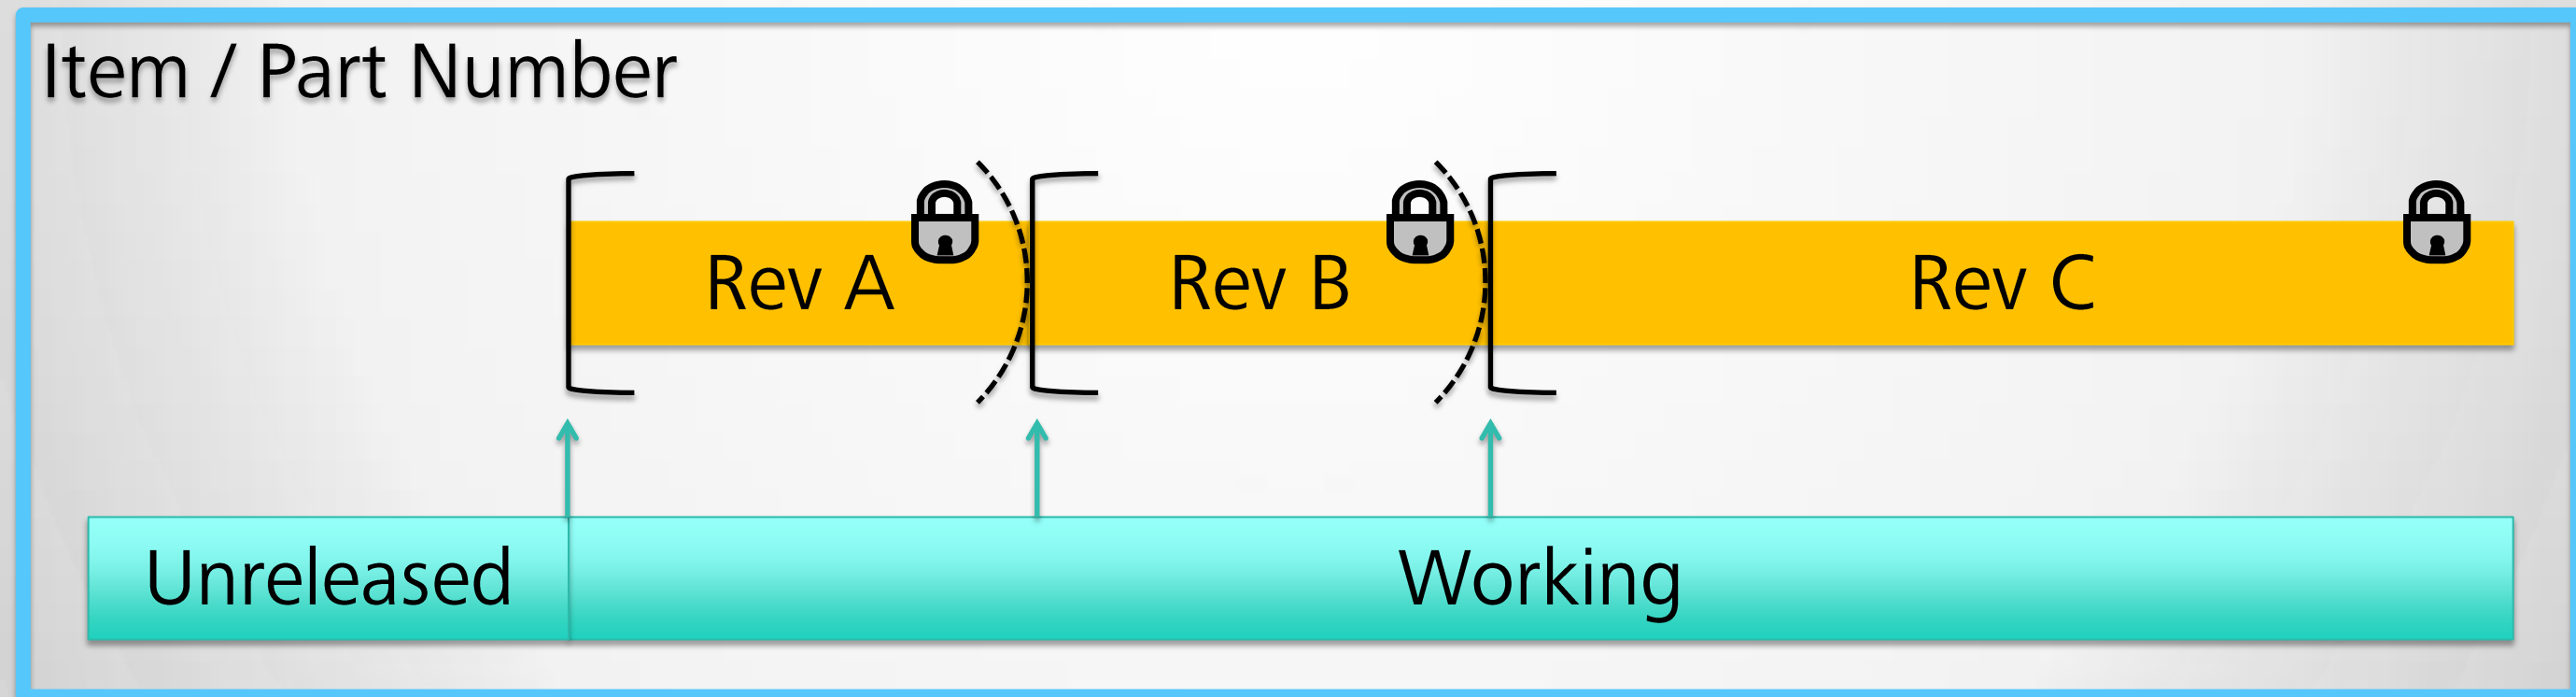

Rev A
[In Design]

Rev B
[In Design]

Rev C
[Production]

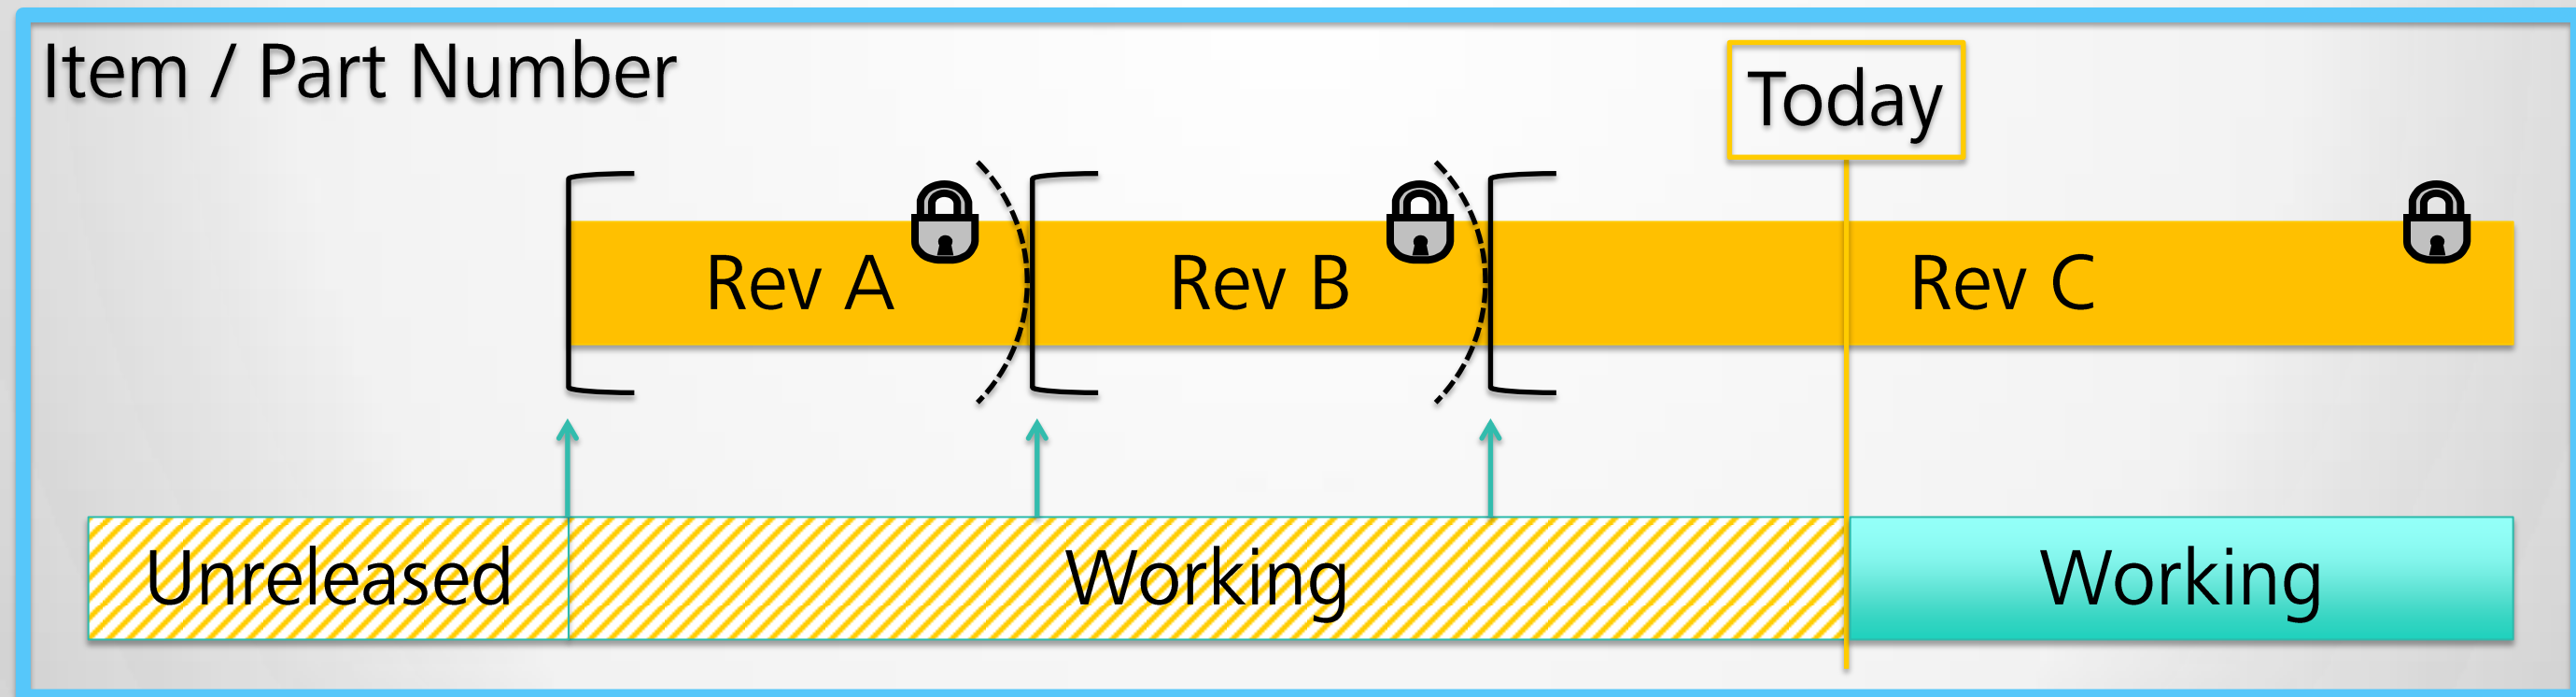

Working Revision

- 'Working' is always available for editing
- Revisions are Locked

Working Revision Has No History

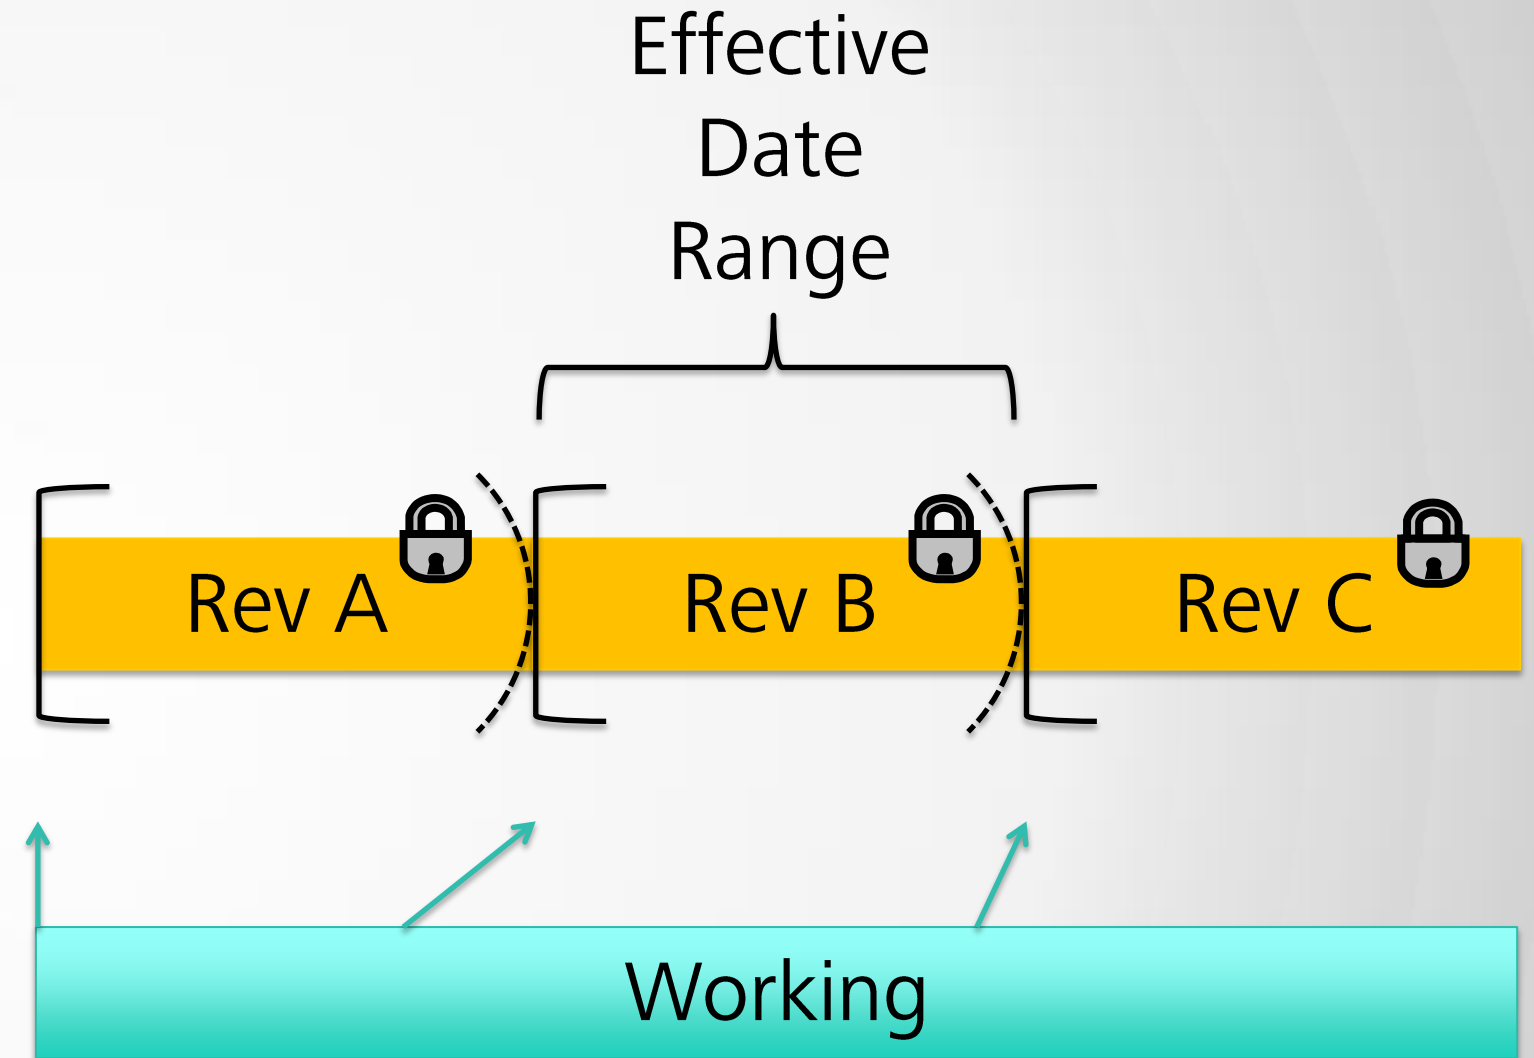

**No way to ask
'What did Working look like
a month ago?!'**

Effectivity

- Sometimes, there is a gap between the ***Approval Date*** and the ***Effective Date***

To avoid gaps in Effective Range, PLM 360 has no 'End Effectivity'

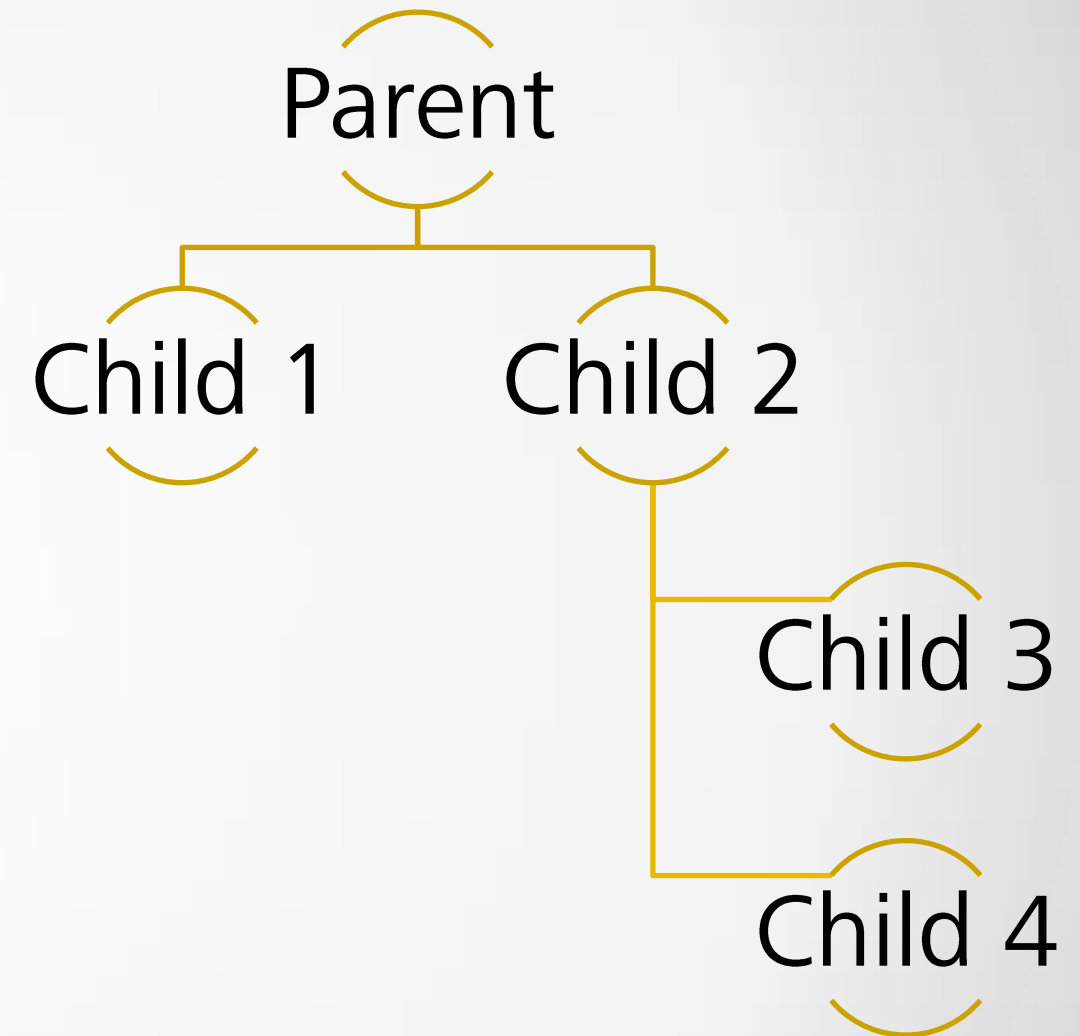

DEMO

Items, Revisions, and Effectivity

BOMs, BOM Relationships, and BOM Configuration

What Is A BOM

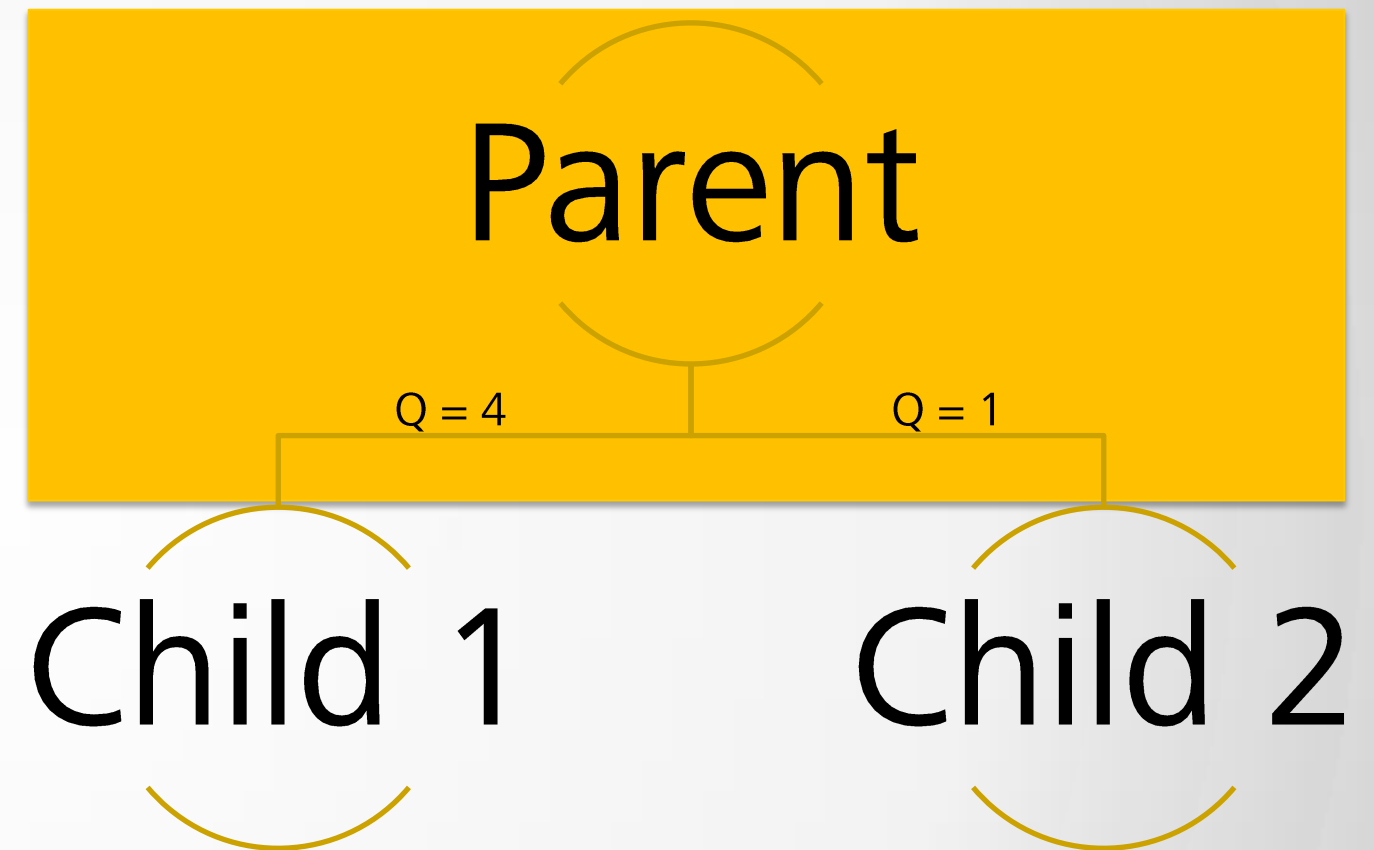

- A Parent, or Assembly, is 'Made-Of' one or more Child, or Part items
- Every item can be both a Parent and a Child

Any item may have a BOM

BOM Relationships Are Property Of The Parent

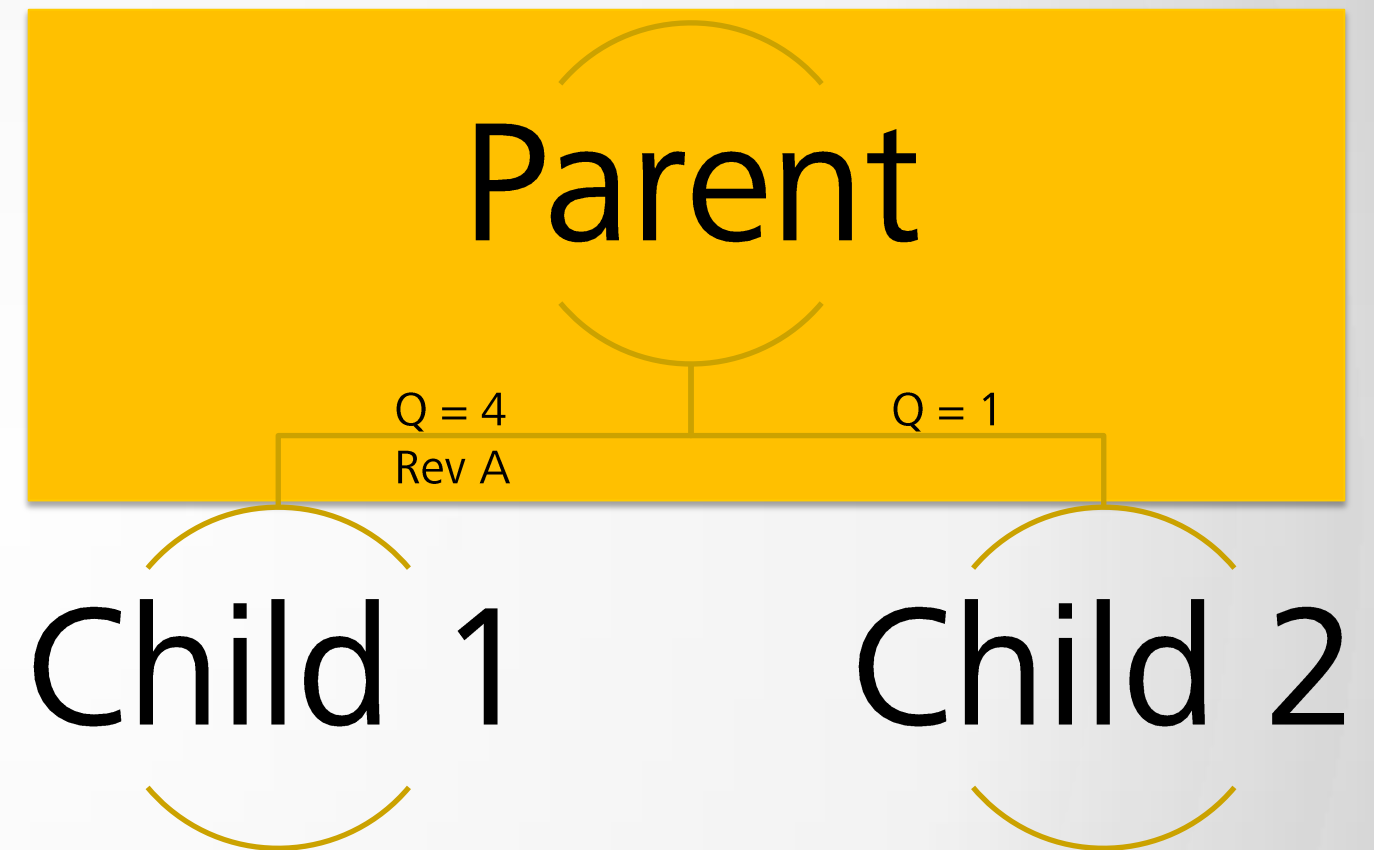

- BOM relationships are owned and managed by the Parent item
- Multi-level BOMs happen when you have a BOM relationship between two Parent items
- However, BOM edits are always one-level deep

To change the BOM or any BOM Property, the parent item must be revised

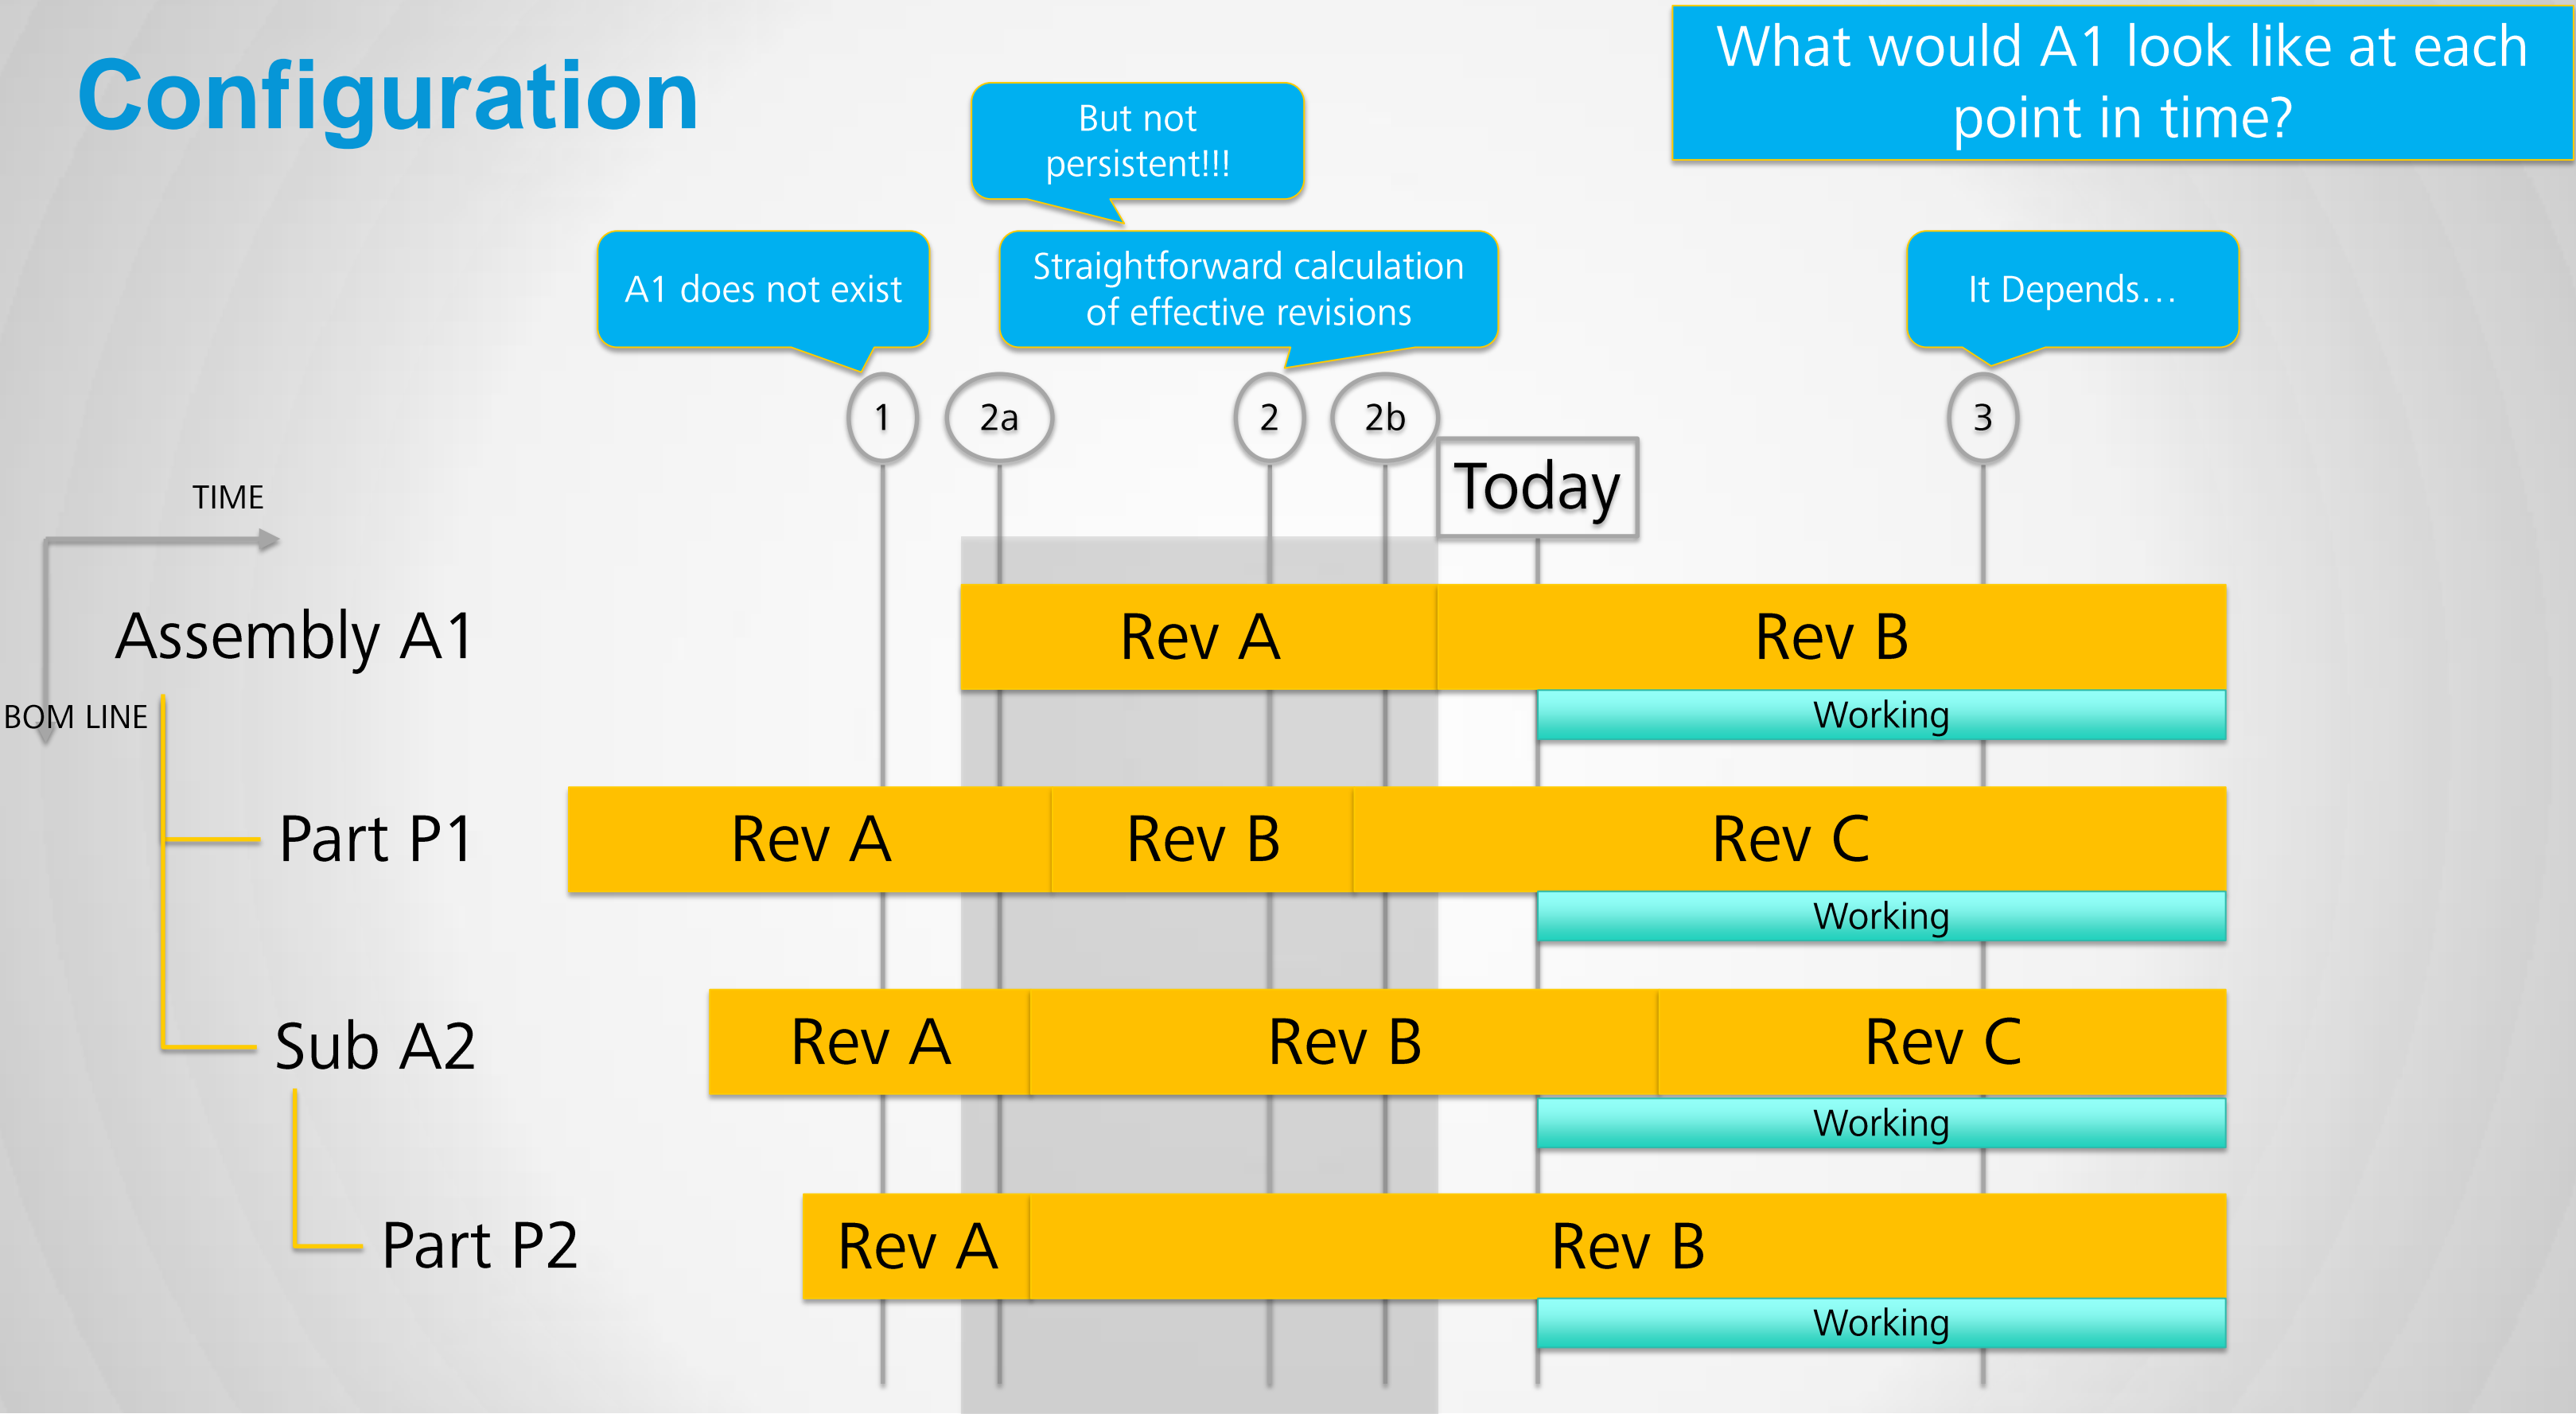

Built-In BOM Properties

- Line Number
- Quantity
- Float/Fixed Revisions ('Revision Pinning')
- Sourcing Quote

If enforcing the 'no change to Fit, Form or Function' rule for new Revisions, you should never need to use Pinning!

Configuration

1.6	155-0000-000 - M12 X 45 mm Long, SHCS Drive, [REV:A]	A	Production	9.0	EA	<input type="checkbox"/>	
1.7	402-0017-000 - BALL BEARING [REV:A]	A	Production	1.0	EA	<input type="checkbox"/>	

Revision Configuration

- Released Revisions
 - Choose the released revision effective on the As-Of date
- Working Revisions
 - Choose the working revision, unless a revision is Pinned
- Pending Changes
 - If working revision is associated to same Change Order as the current item, use it. Otherwise, use the Released revision in effect
- All Pending Changes
 - If working revision is associated to any Change Order, use it. Otherwise, use the Released revision in effect

Revision Configuration other than Released is only applicable for Today and Future As-Of Dates

Change Management and Change Impact Assessment

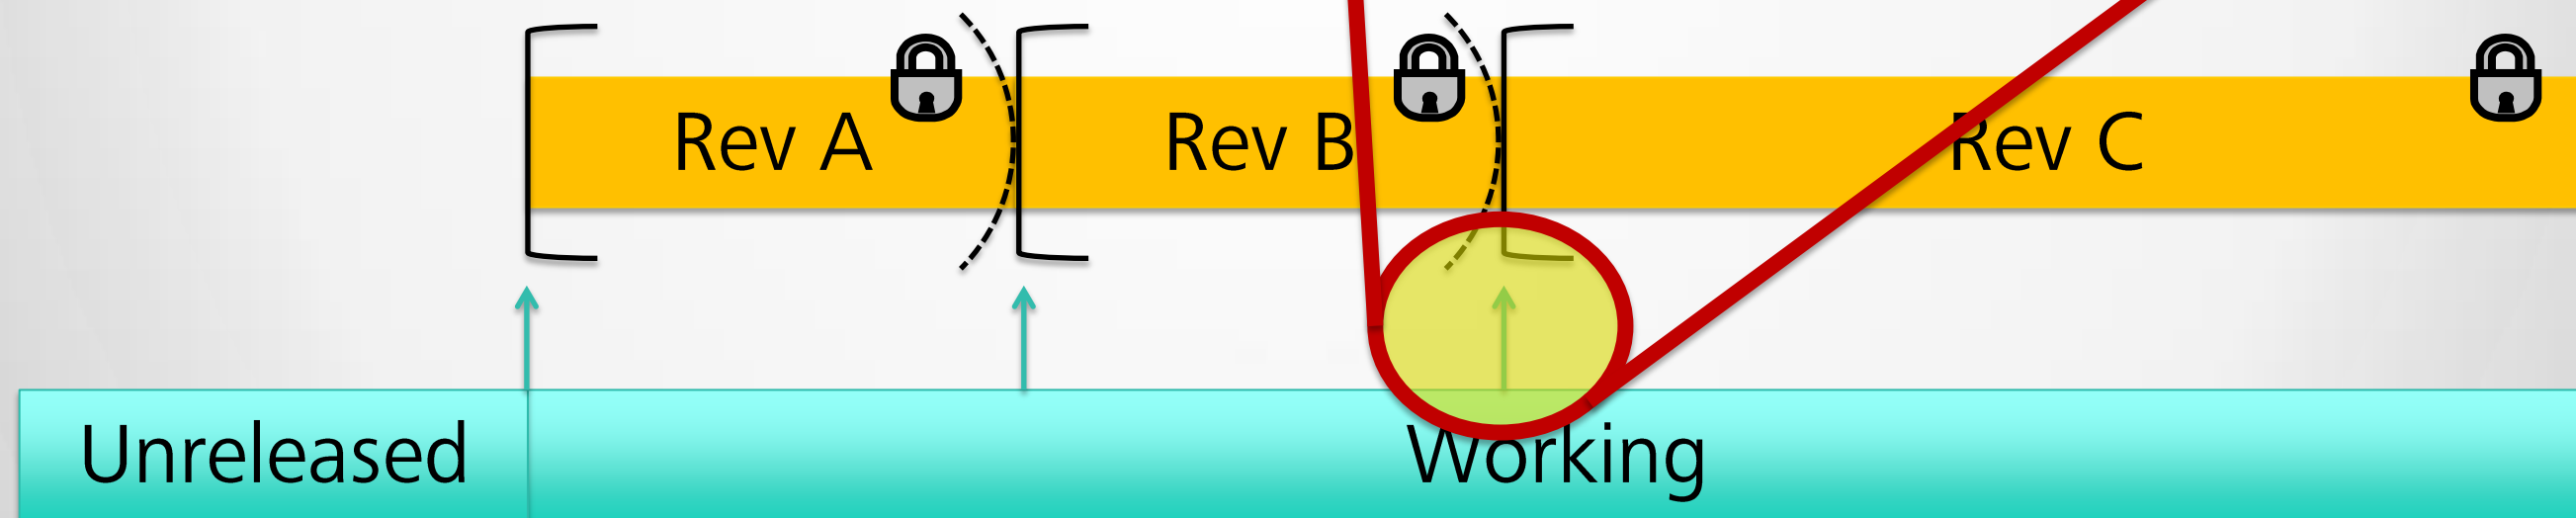

Release/Revision Process

Approval Process is associated to a Revisioning Item aka Change Order

Approval Process

Item / Part Number

Use Change Order To Revision Items

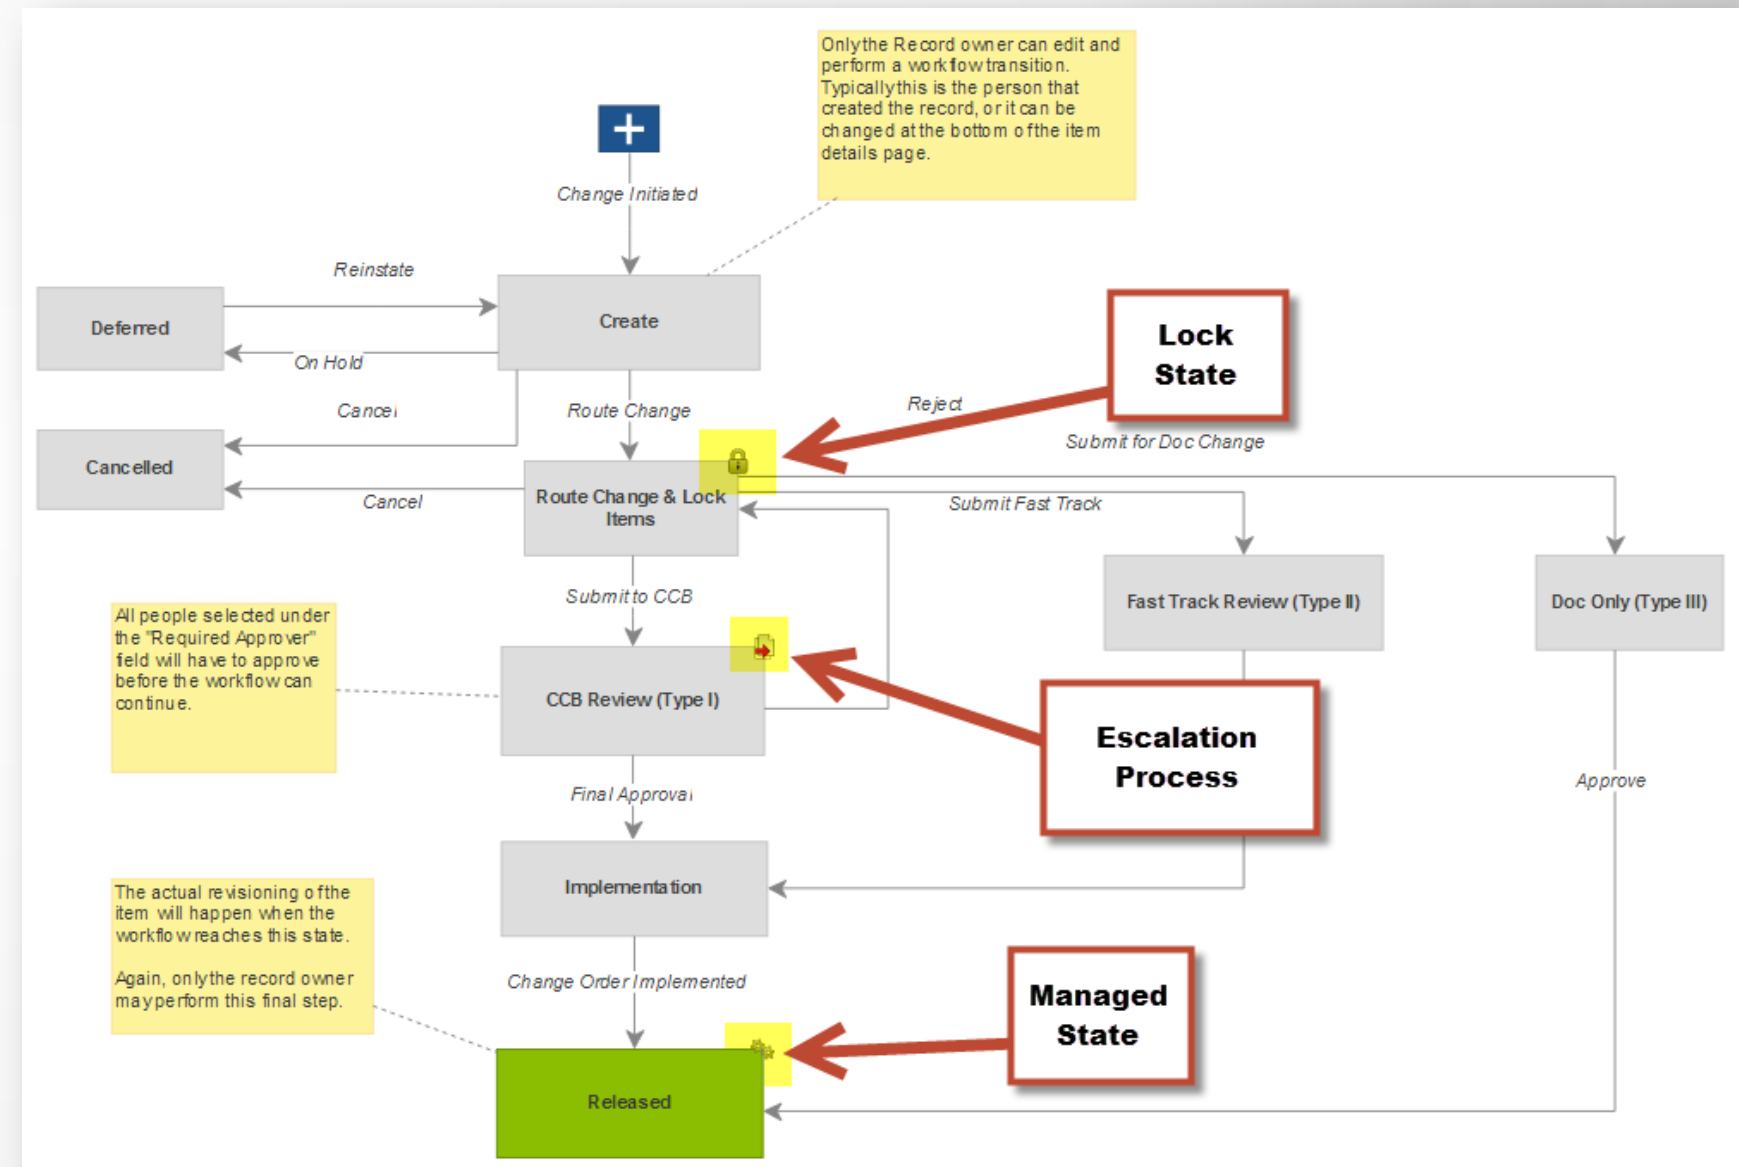

- Change Order is used to Release/Revise an item
 - Set Lifecycle transition
 - Set Effectivity
- Consistent with CMII practice

The screenshot shows a software interface for managing change orders. The title bar reads "CO000002 - Change Valve Fitting - 3 - High". Below the title bar, there is a "State" section with "Route Change & Lock Items" and a lock icon. A tabbed interface shows "Affected Items (1)" as the active tab, with other tabs including "Item Details", "Change Tasks (2)", "Impacted Products (1)", "Attachments (1)", and "Workflow Actions". Below the tabs are "Save" and "Cancel" buttons. The main area contains a table with columns: "#", "Item", "Lifecycle", and "Effectivity". The table has one row with the item "163-0000-000 - VALVE BALL 1/2\" Female-Female Threaded , [REV:w]". The "Lifecycle" column has a dropdown menu open, showing options: "Production Revision", "Select...", "Production Revision", and "Obsolete". The "Effectivity" column shows "On Release" with a calendar icon, and "Today" and "Clear" buttons. At the bottom of the table are "Save" and "Cancel" buttons.

#	Item	Lifecycle	Effectivity
1	163-0000-000 - VALVE BALL 1/2" Female-Female Threaded , [REV:w]	Production Revision	On Release

Change Order Workflow

- Fully customizable
- Noteworthy
 - Lock State
 - Managed State
 - Escalation Process
 - Fast Track (CMII recommendation)

Assess Changes

- Compare from ECO
 - Open the item
 - Initiate compare
 - Default to comparing the 'To Be' state of the item to the 'Latest Release'

Item Details ▼ Workflow (0) Workflow Actions **Managed Items (1)** Attachments (0) Change Log (4)
