

# Connecting Autodesk to the Internet of Things

Kean Walmsley  
Autodesk Research  
@keanw

# Class summary

The Research Team at Autodesk, Inc., has been developing technology for the Internet of Things (IoT) since before people called it that. Project Dasher is a building performance management tool that displays historical and real-time sensor data inside a building model. The Research Team has taken the learning acquired while developing Project Dasher and used it to create technology that addresses the needs of the broader IoT market. This session will look at how IoT APIs (application programming interfaces) from Autodesk Research can be used to display information in websites integrating the viewer from the Forge Platform to inform the design process and even power generative design. This session features Forge and Dynamo Studio.

# Key learning objectives

At the end of this class, you will be able to:

- Learn what Autodesk Research is doing with IoT
- Learn how to use IoT APIs to access historical and real-time sensor data
- Learn how to integrate visualization components from Autodesk Research into Autodesk viewer applications
- Learn how to call IoT APIs from Dynamo Studio to power generative design

# About me

- 21 years at Autodesk
  - UK ➔ Switzerland ➔ USA ➔ India ➔ Switzerland
  - 16.5 years in the Developer Network
  - 4 years in AutoCAD Engineering
  - 8 months in Autodesk Research
- 10 years blogging at [Through the Interface](#)
  - AutoCAD development, now Forge, IoT & AR/VR

# Autodesk Research and Project Dasher

# Autodesk Research

- A small team acquired with Alias in Toronto
- Now 100+ people in 5 countries

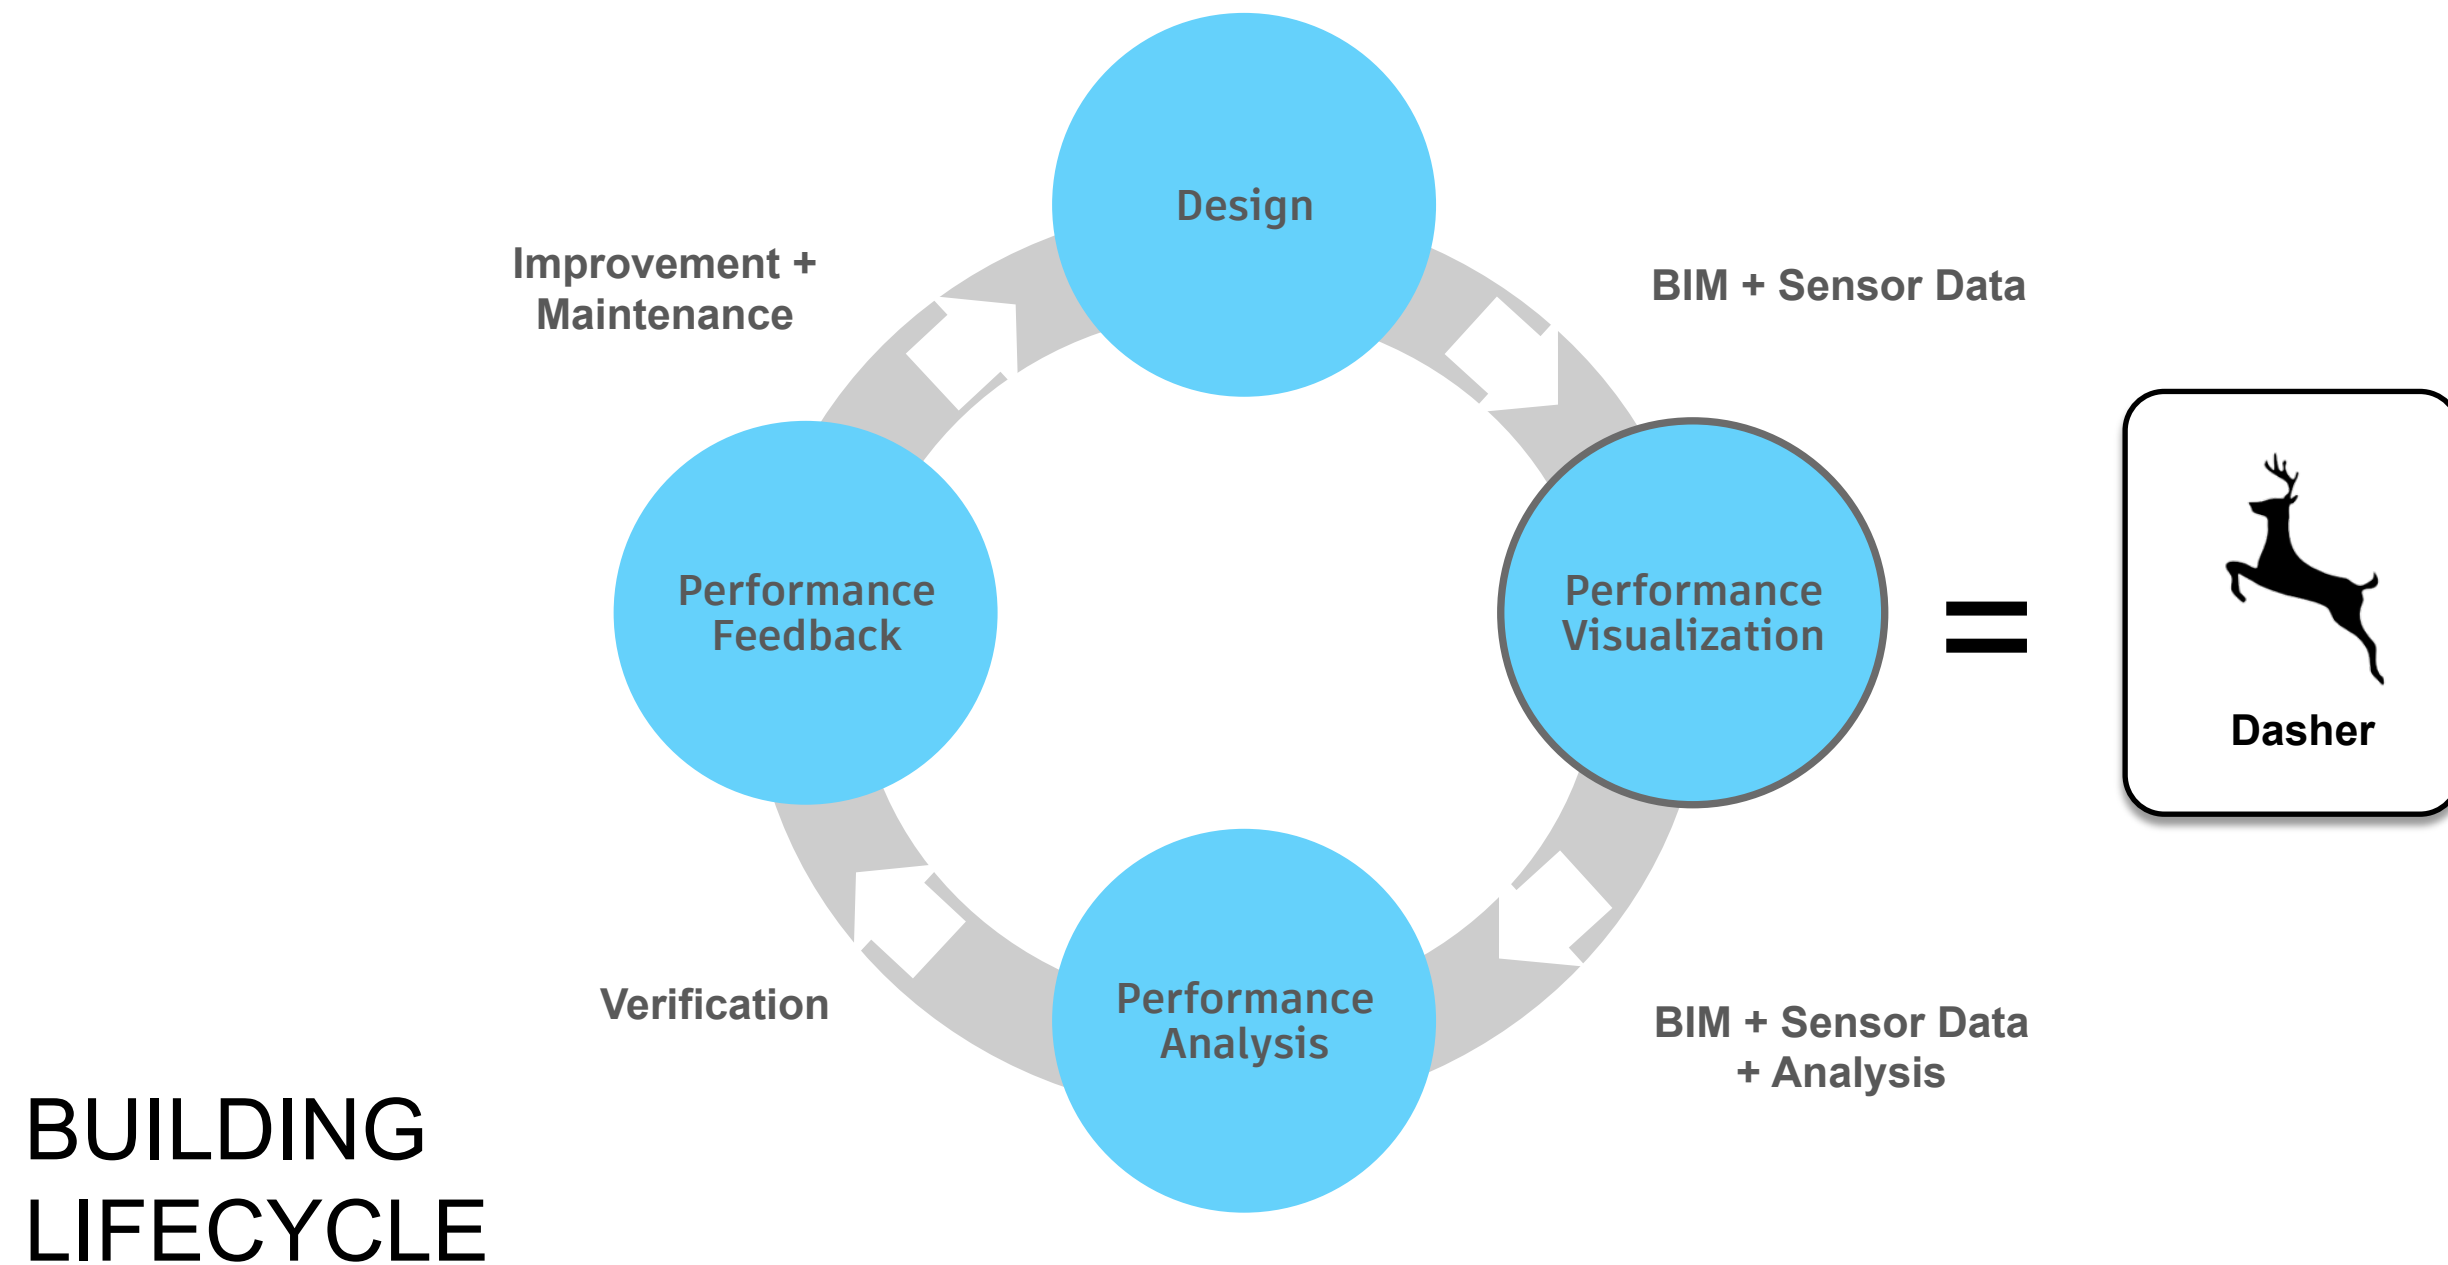

Headed by Gord Kurtenbach  
Reporting to Jeff Kowalski (OCTO)

Increasingly focused on technology transfer  
Meshmixer, Draco, Dreamcatcher

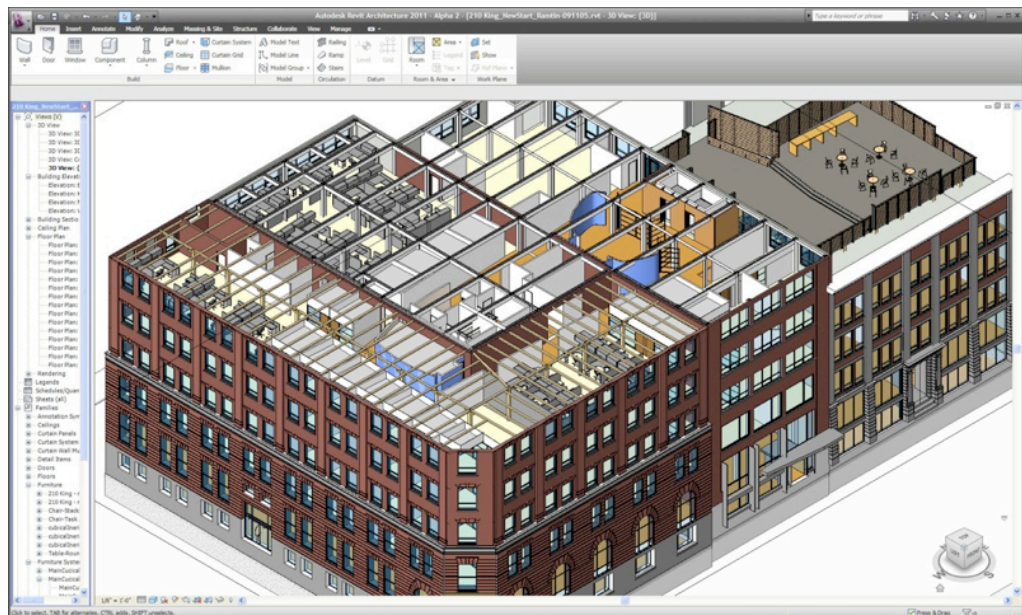

# Project Dasher

A visualization tool for improving building performance

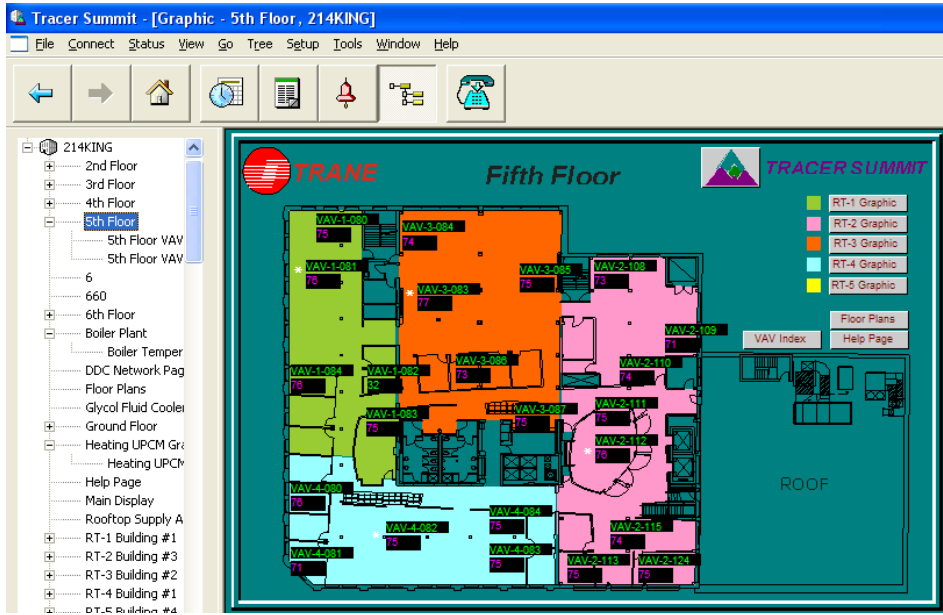

# Project Dasher

Project Dasher is BIM plus sensors + meters

**Building Information Modeling (BIM)**  
Detailed architectural, structural, mechanical, and electrical models

+

**Building Management Systems (BMS)**  
User interface for data visualization, control, and automation of systems

=

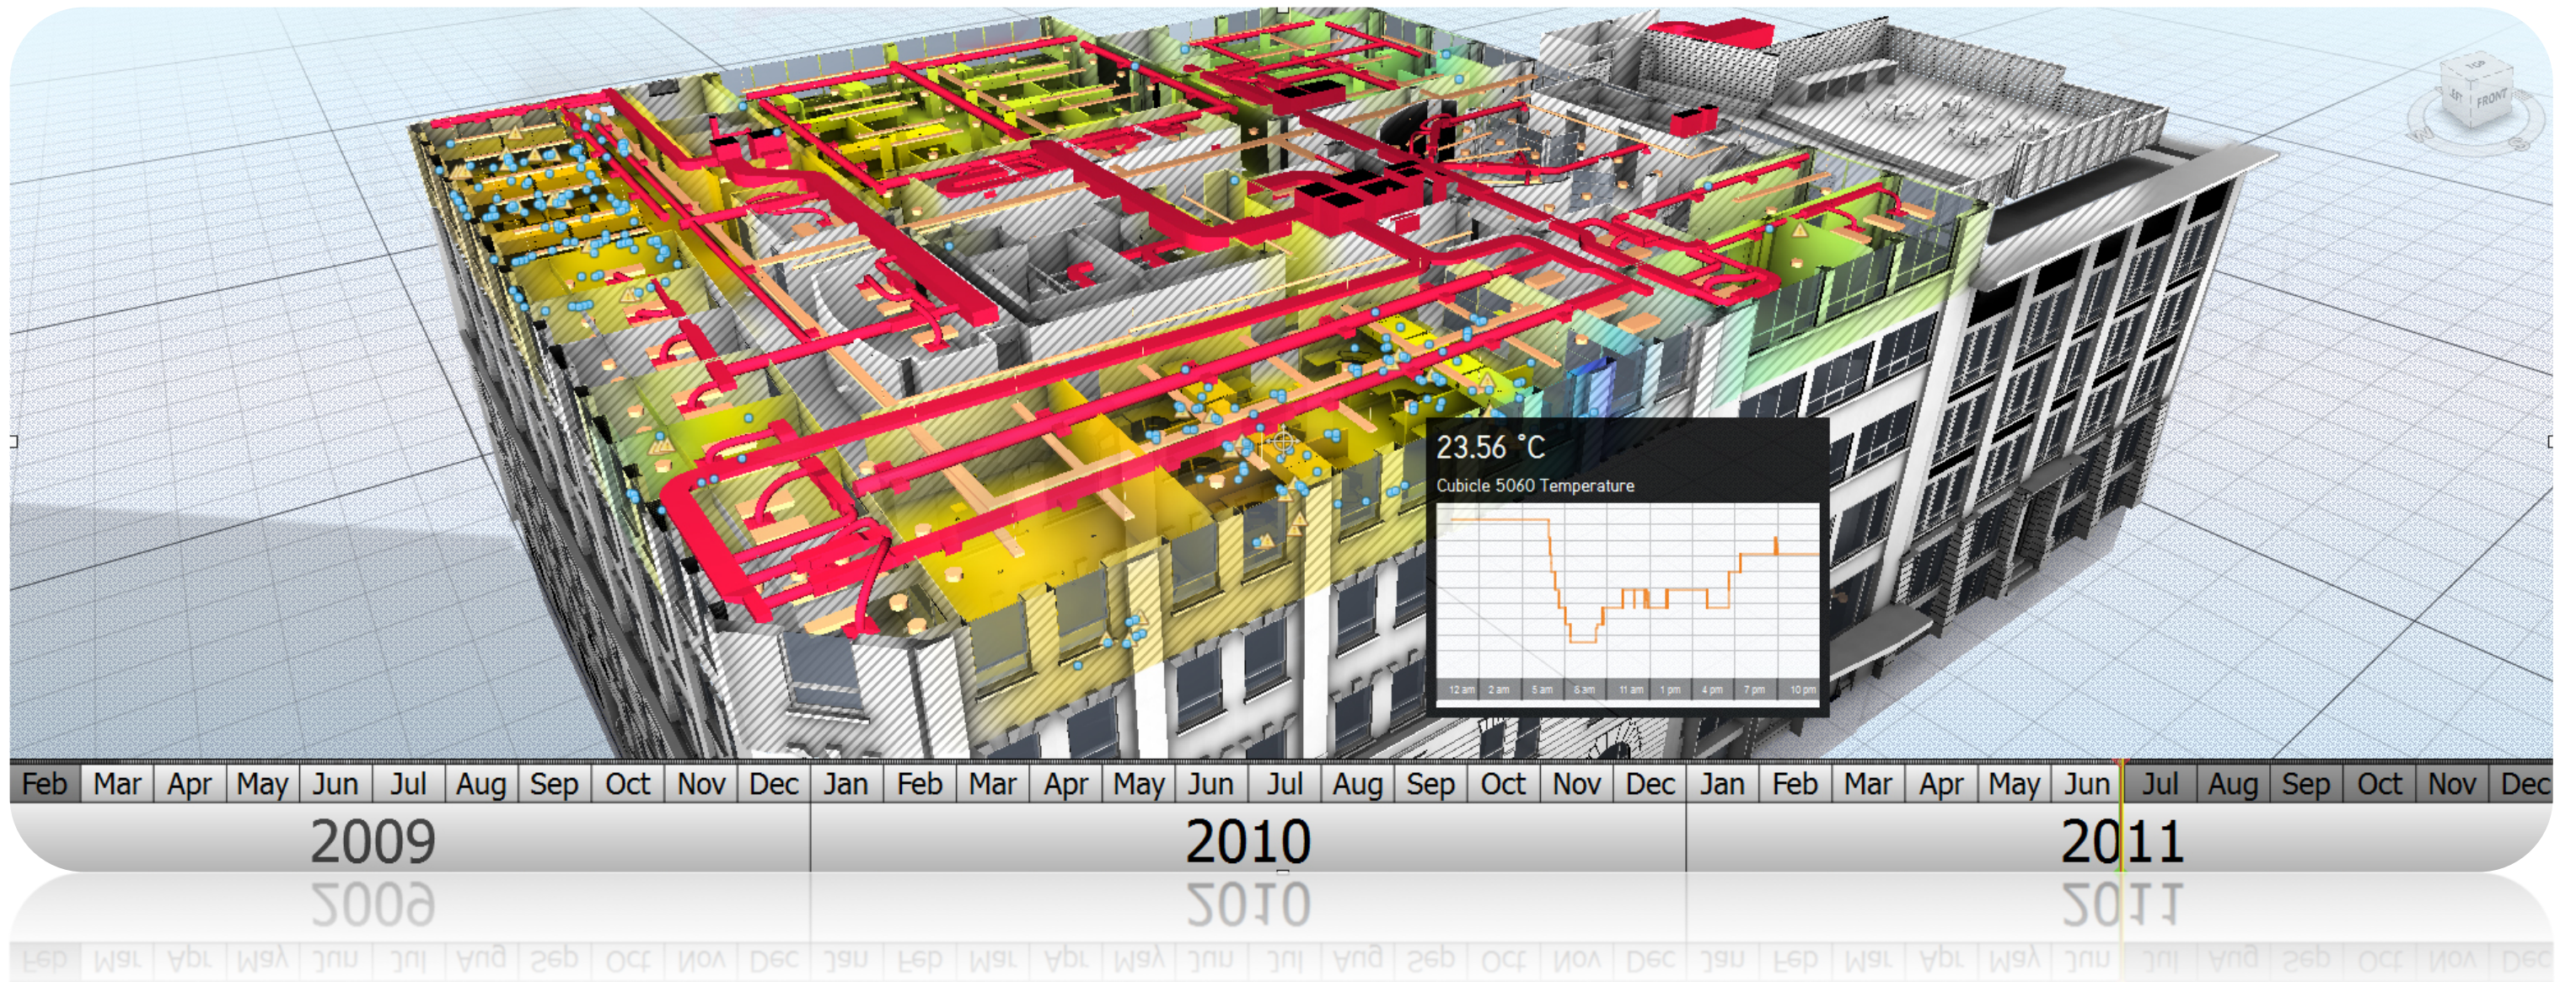

**Project Dasher**  
Historic and real-time data visualization in 3D space

# Project Dasher

Extends BIM as a life-cycle tool

A 3D architectural rendering of an office space, viewed from an elevated perspective. The office is furnished with several desks, each equipped with a computer monitor and an ergonomic chair. The desks are arranged in a somewhat irregular pattern, with some facing each other and others facing away. The walls are a light, neutral color, and there are large windows on the right side of the room, letting in bright light. The floor is a light gray. The entire scene is bathed in a green-to-yellow gradient, with the green being more prominent on the left and the yellow on the right. The text "The History of Project Dasher" is overlaid in the center of the image, in a bold, black, sans-serif font.

# The History of Project Dasher

# As-built BIM

Highly detailed model of Autodesk's Toronto office

# Sensors

## Networked Sensor Installation

Sensors installed in the physical environment track light, sound, occupancy, CO<sub>2</sub>, temperature and energy use

## Revit Model w/ Networked Sensors

Sensors are placed and uniquely named within the as-built Revit model

# Data resolution

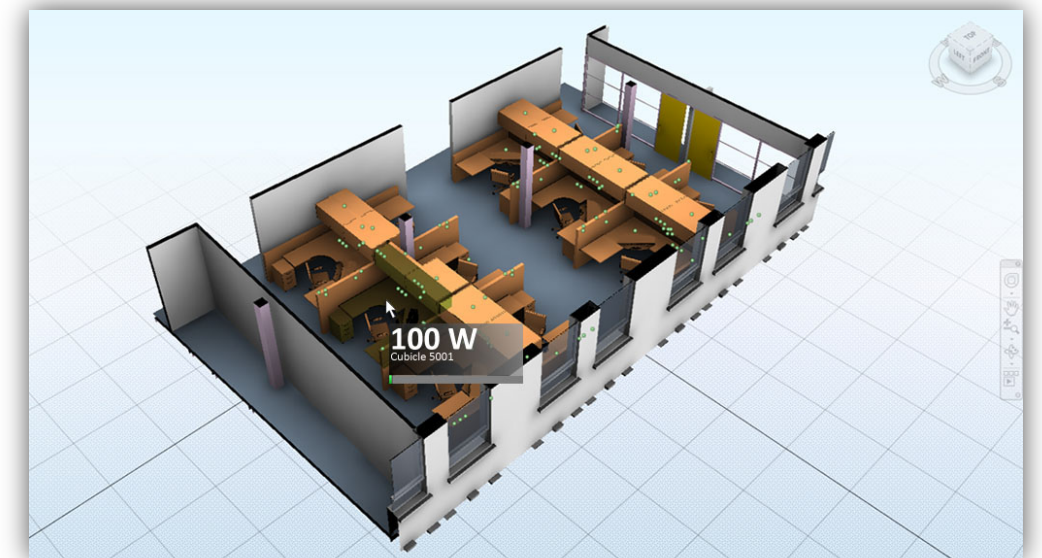

**Floor / Area**  
multiple sensors

**Workgroup / Zone**  
multiple sensors

**Workstation / Individual**  
individual sensors

Increasing levels of detail

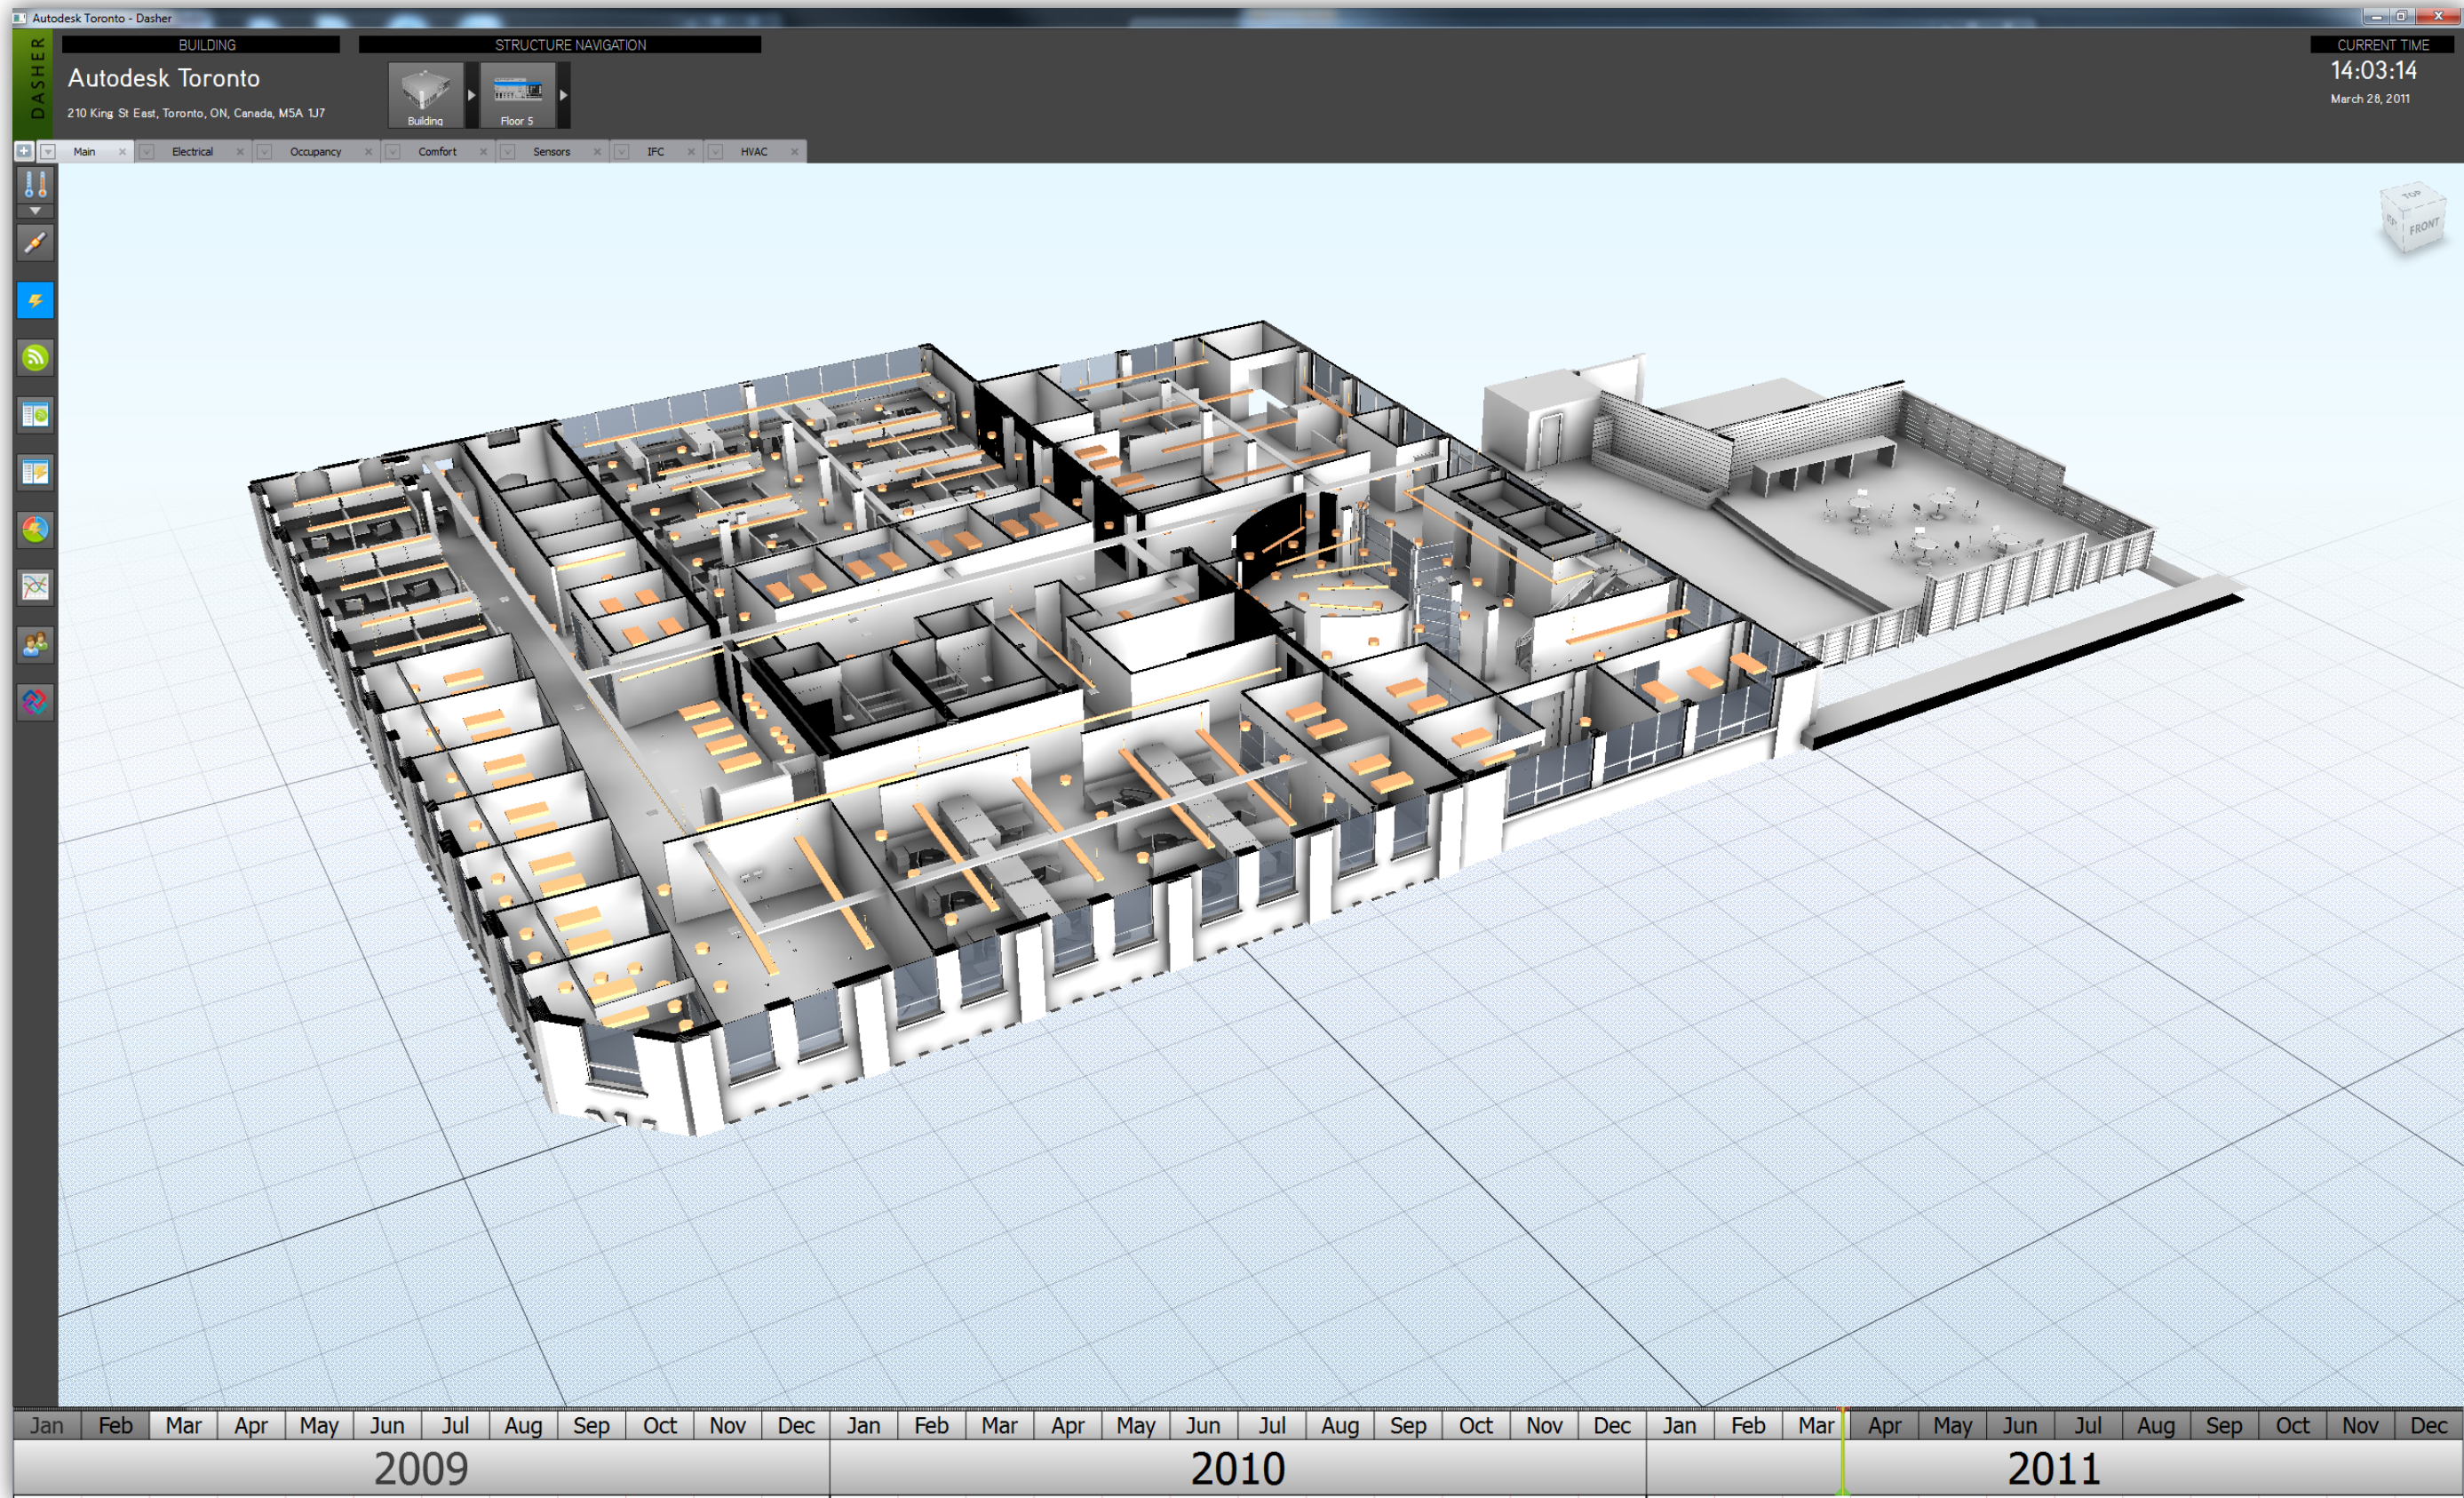

Main x Electrical x Occupancy x Comfort x Sensors x IFC x HVAC x

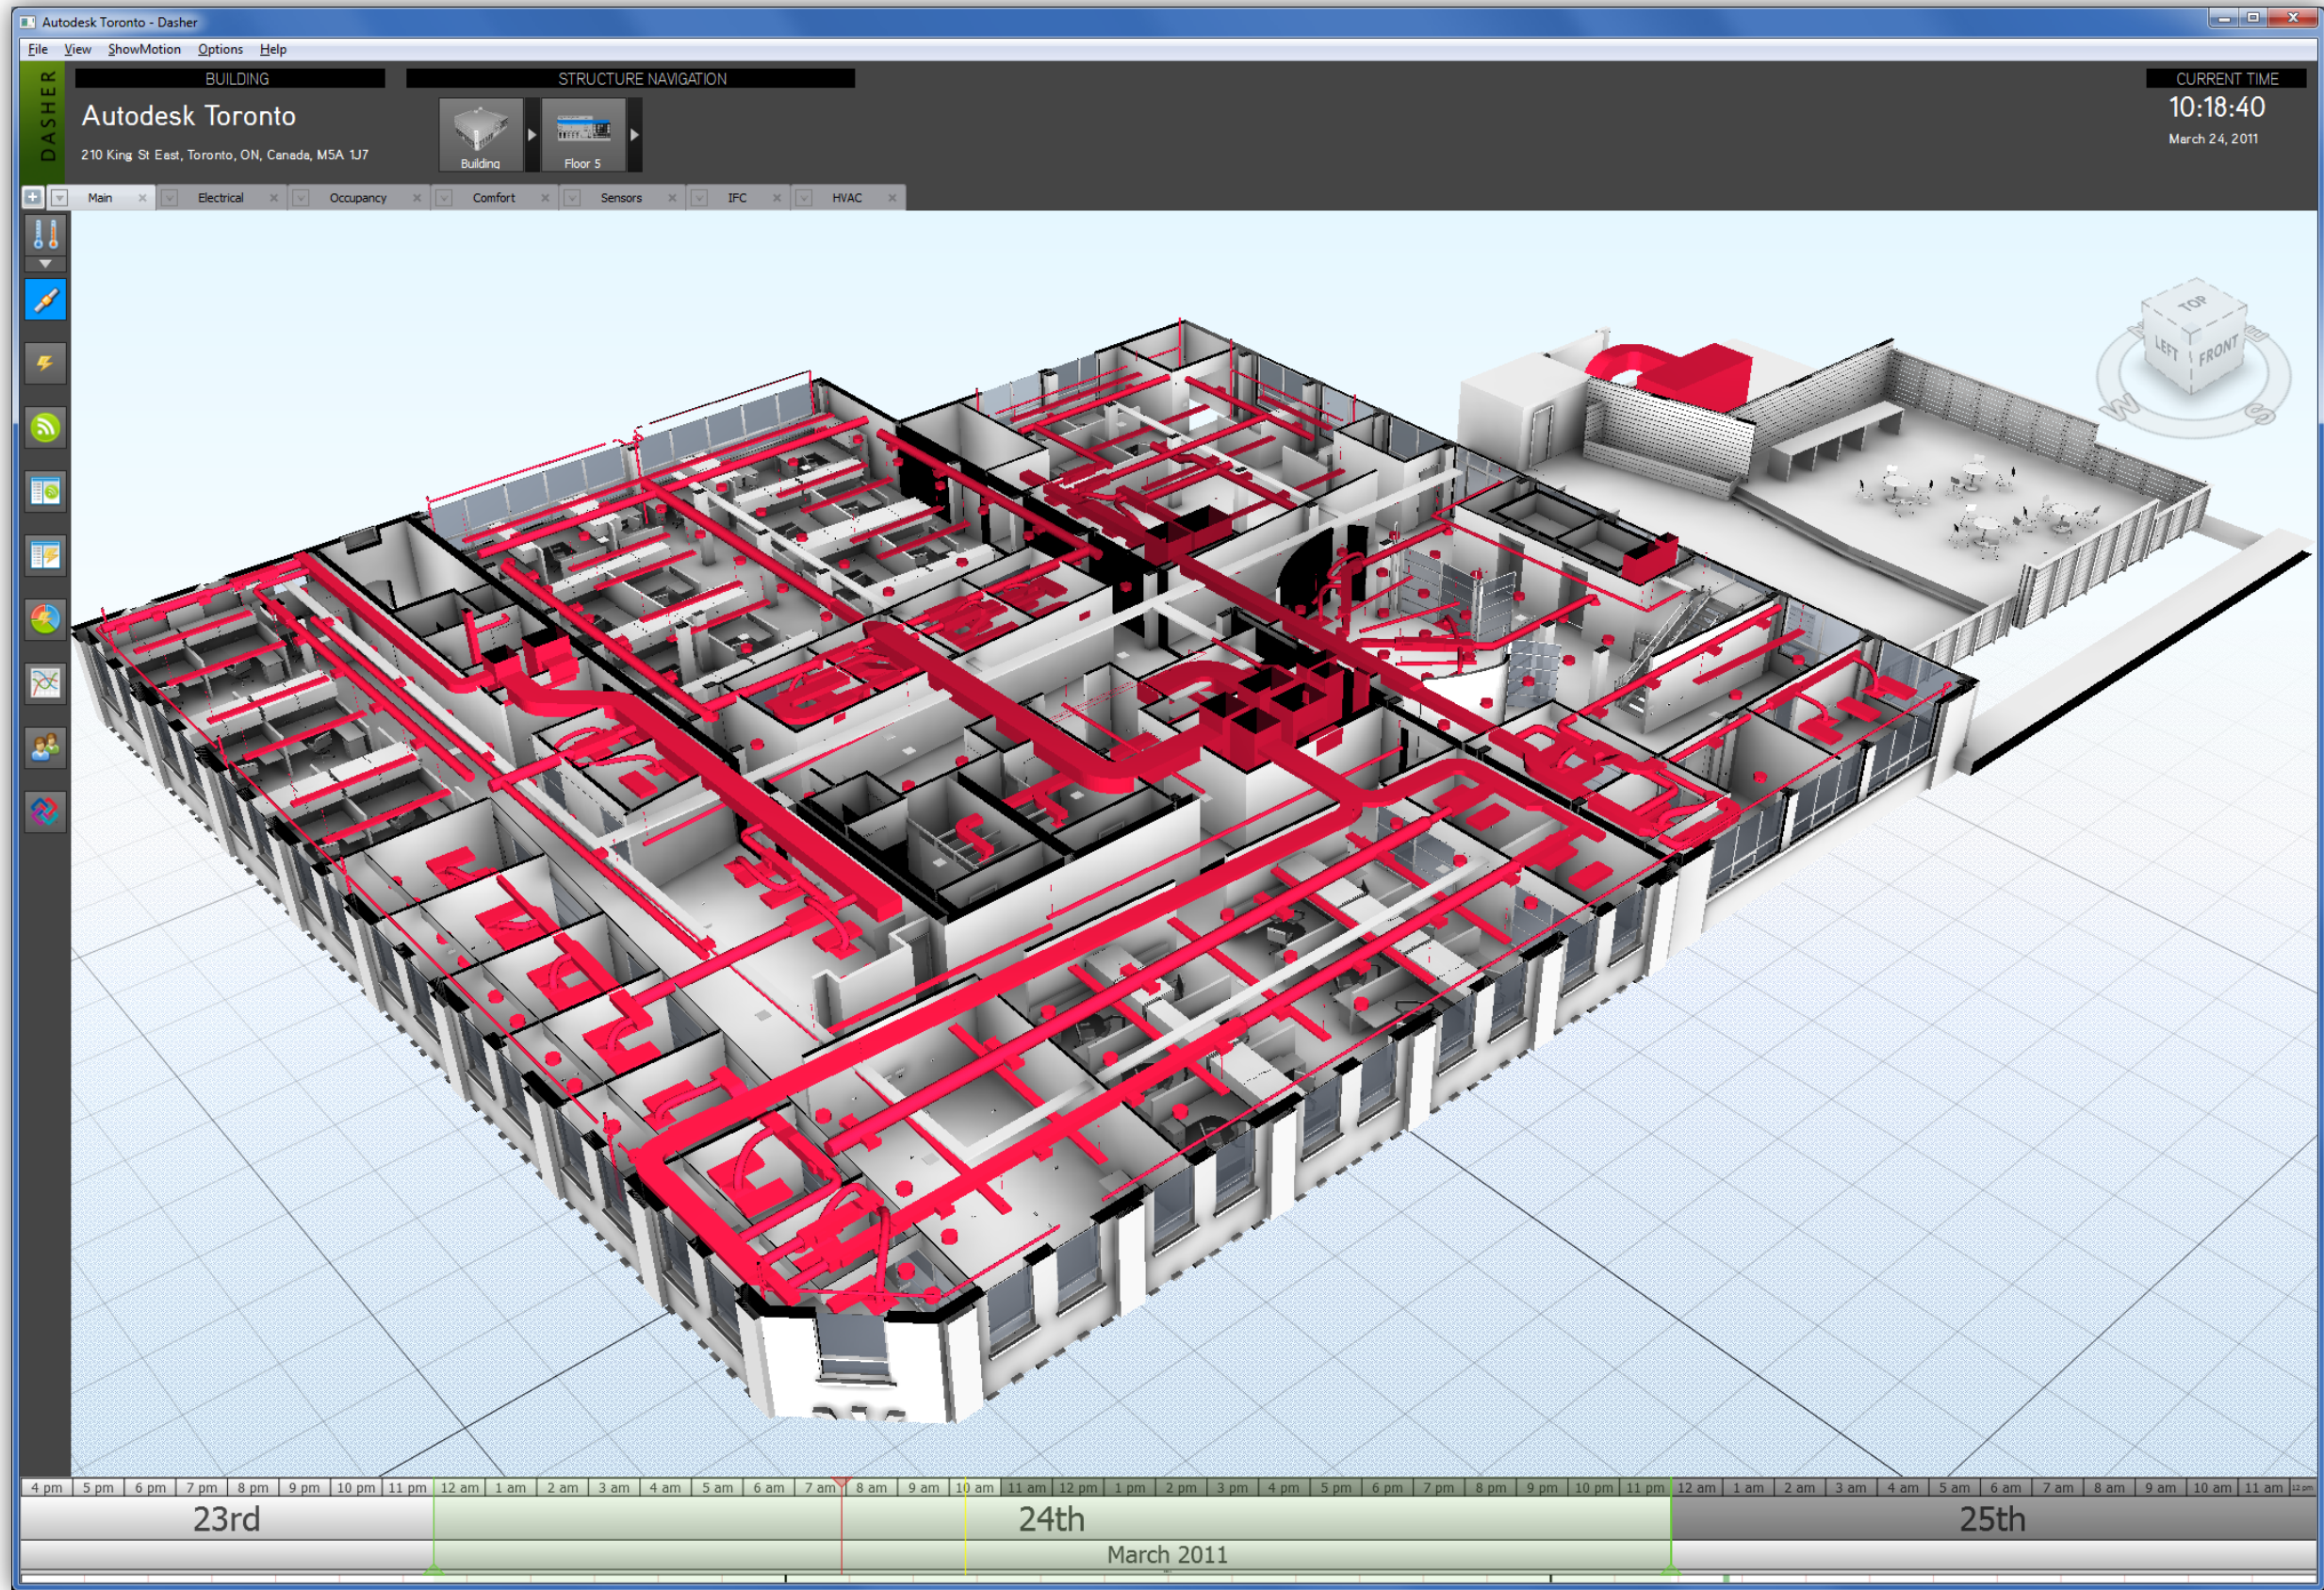

Main x Electrical x Occupancy x Comfort x Sensors x IFC x HVAC x

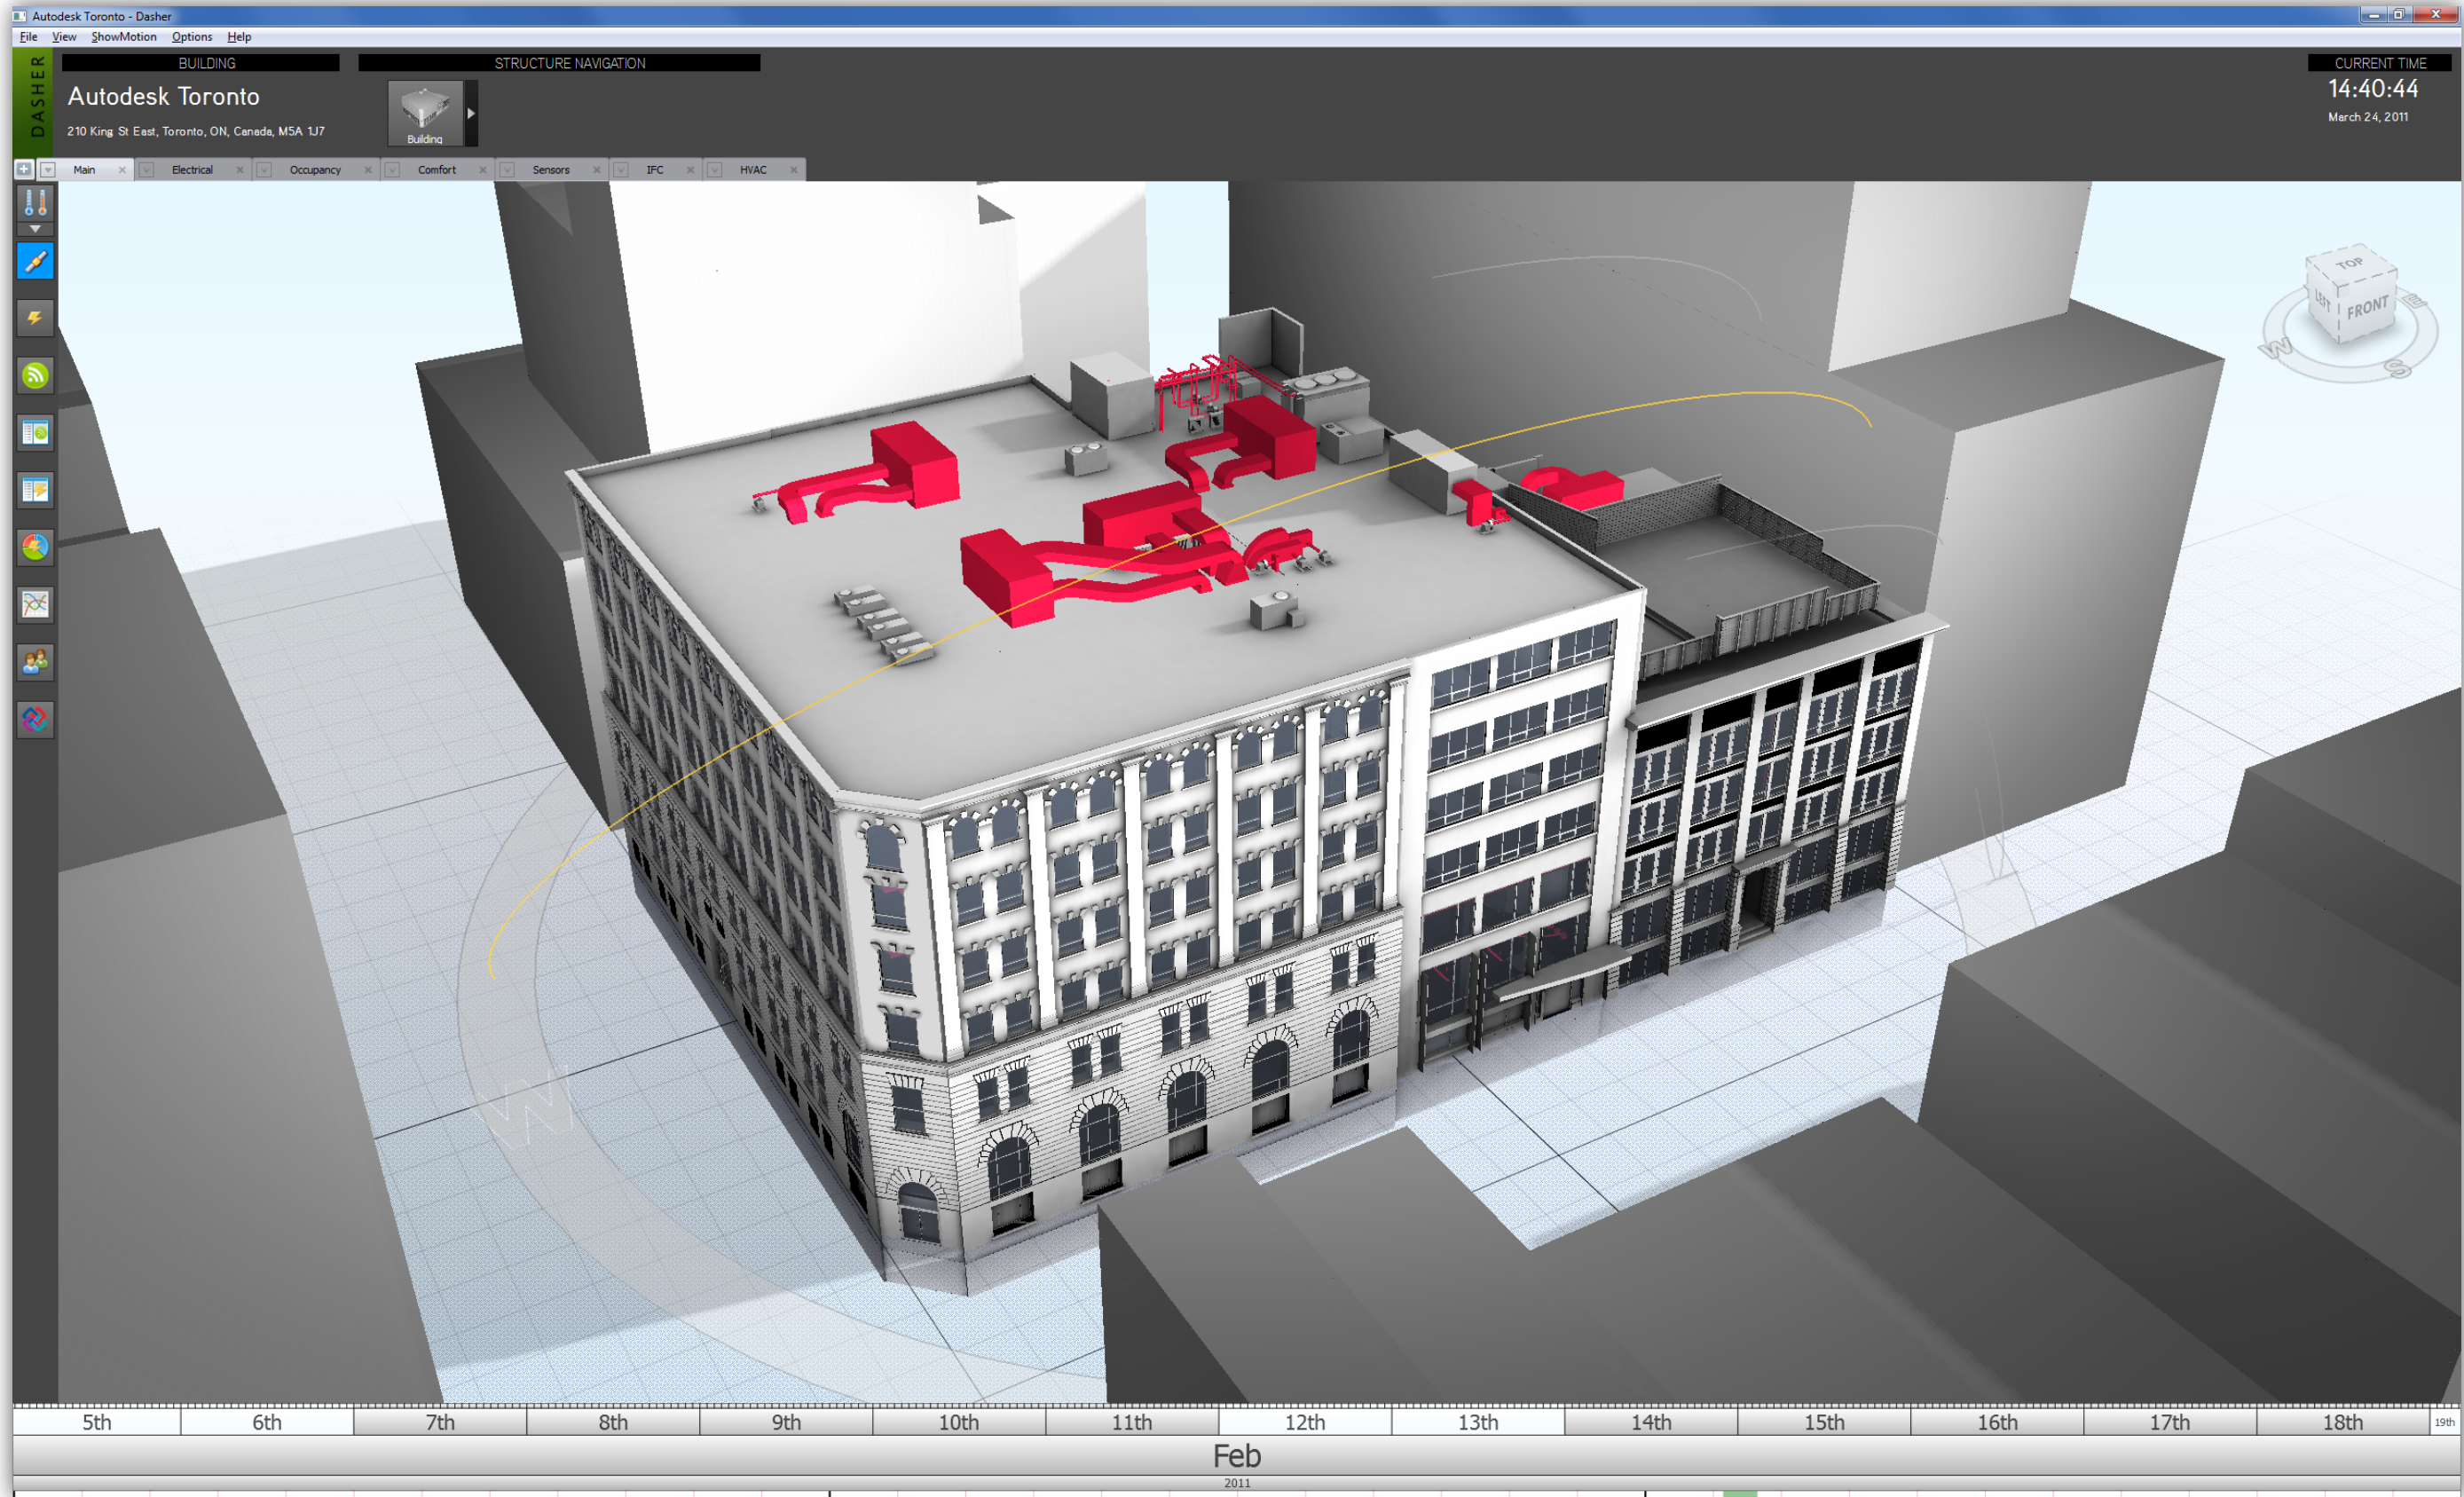

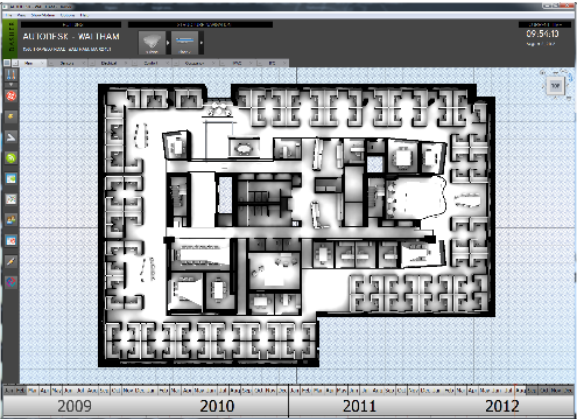

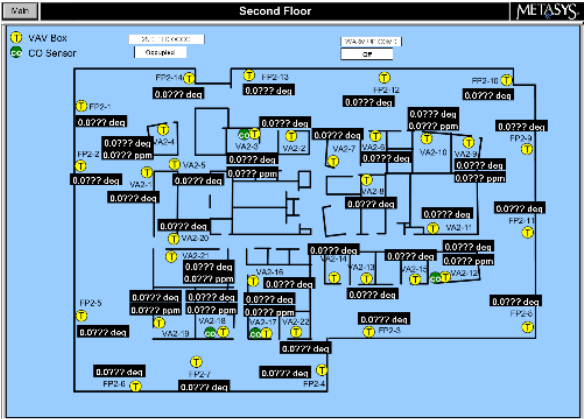

# Project Dasher

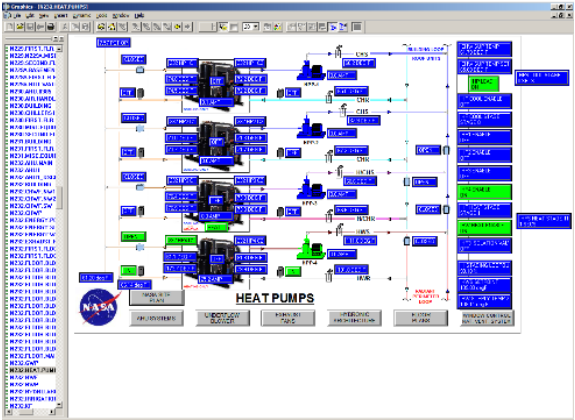

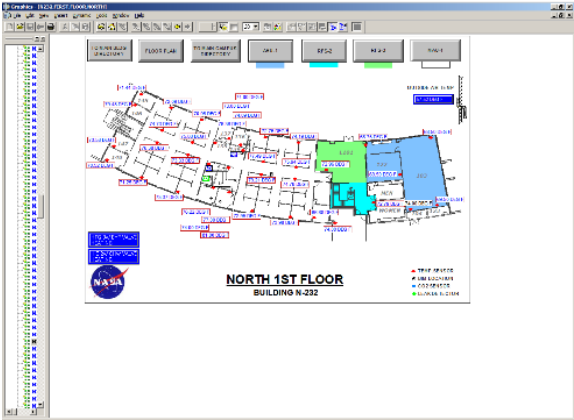

**Operations & Management Interfaces**  
BMS and facility management interfaces  
leave something to be desired

**Project Dasher**  
Merges spatial information with  
live and historic data

Autodesk  
Waltham Office

NASA Ames  
Sustainability Base

Presenting information in a single 3D context

# Where is all that sensor data?

- For Dasher to work, we needed data storage
  - Lots & lots of data storage 😊
- In 2010, time-series databases were immature
  - We rolled our own extensions to HBase
- We now call it Data 360
  - Codenamed Blitzen – the engine powering Dasher

# Data 360

- Highly scalable time-series database
  - Tuned for large volumes of sensor data
  - Multiple levels of detail to avoid slow queries
- Exposes a REST API for data access/import
  - We also create conduits to federate data
- Looking to make this part of Forge, in due course

# Splash

- Data 360 stores different levels of detail
  - We need a viewing component that supports
    - <https://autodeskresearch.com/publications/splash>
  - Like Google Maps for sensor data

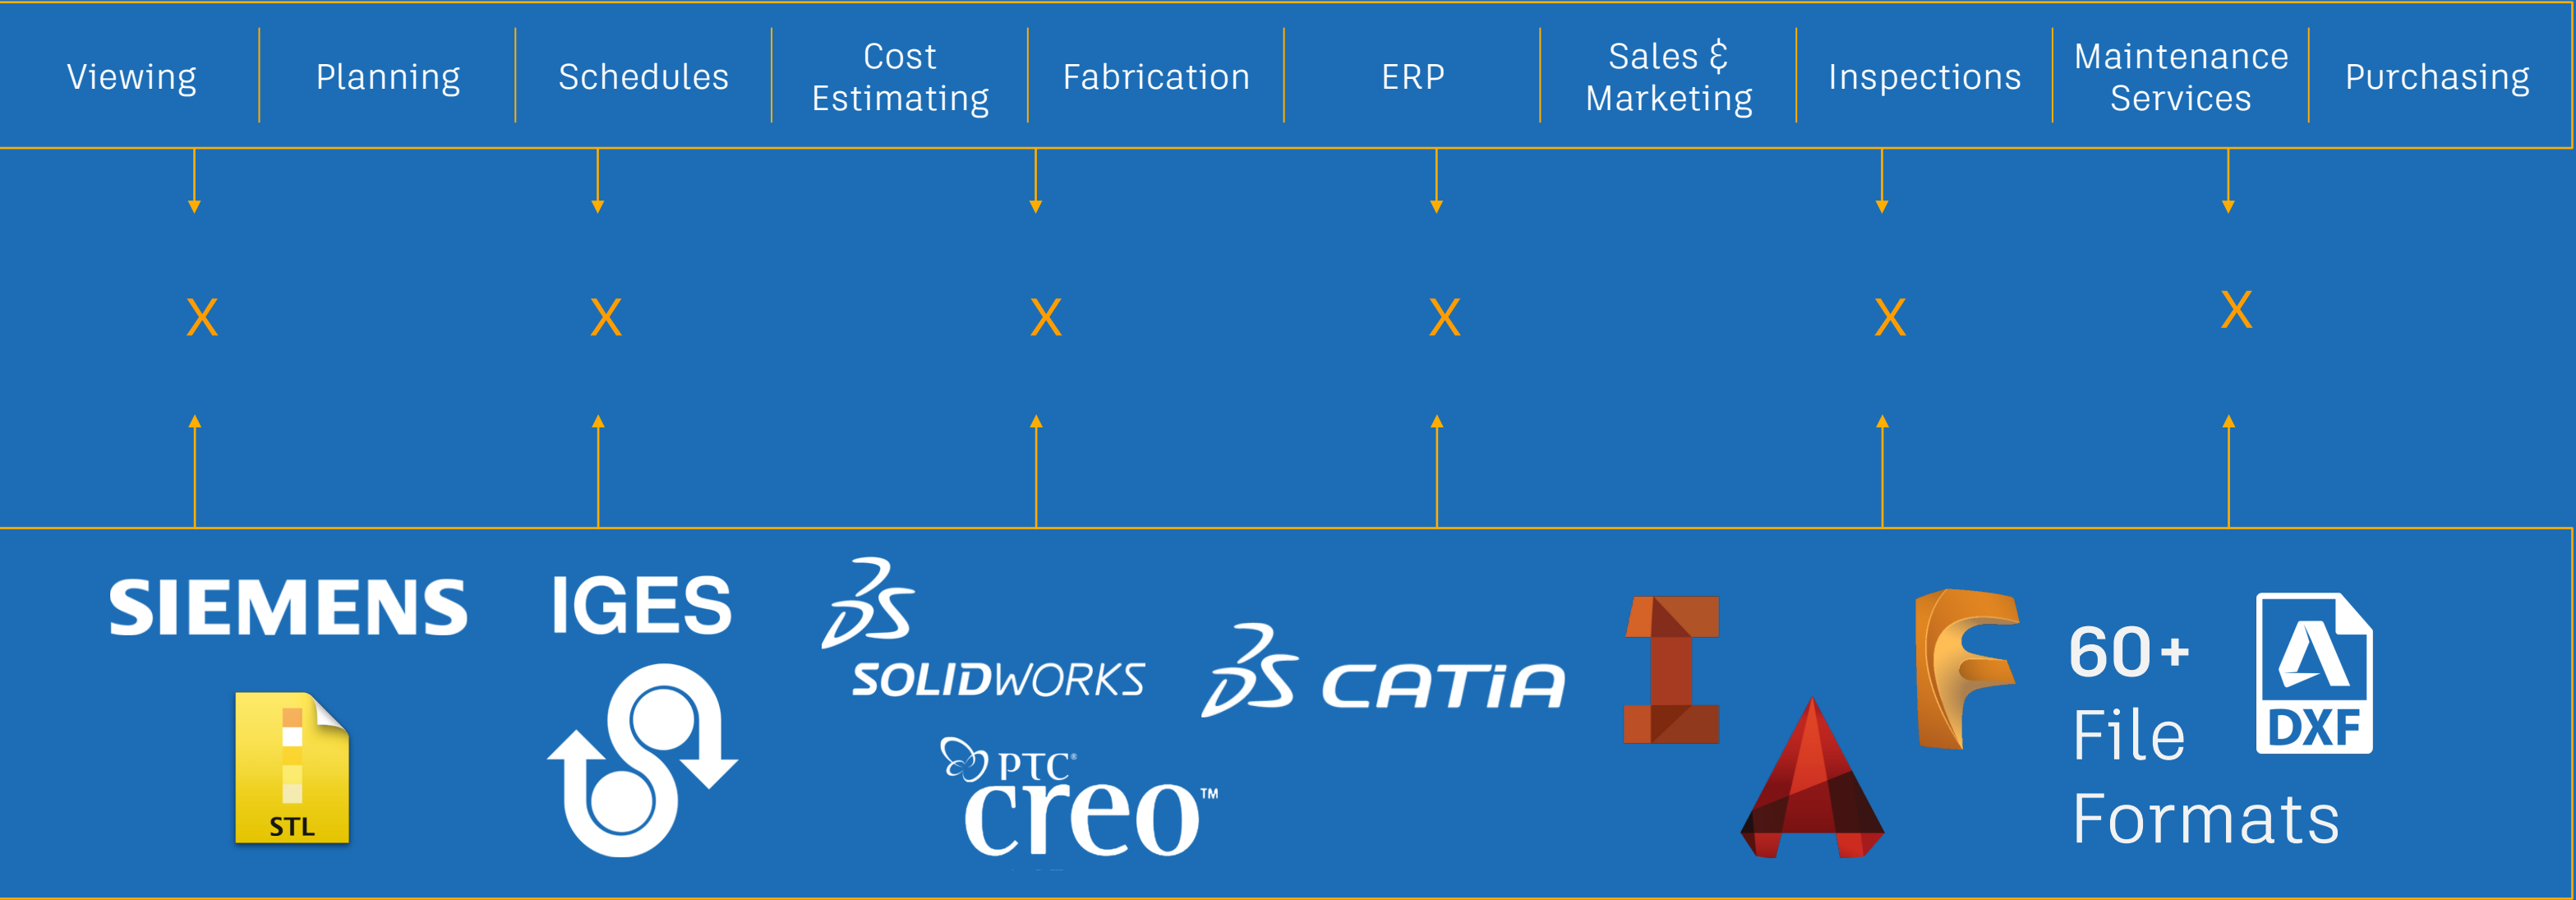

## Demo

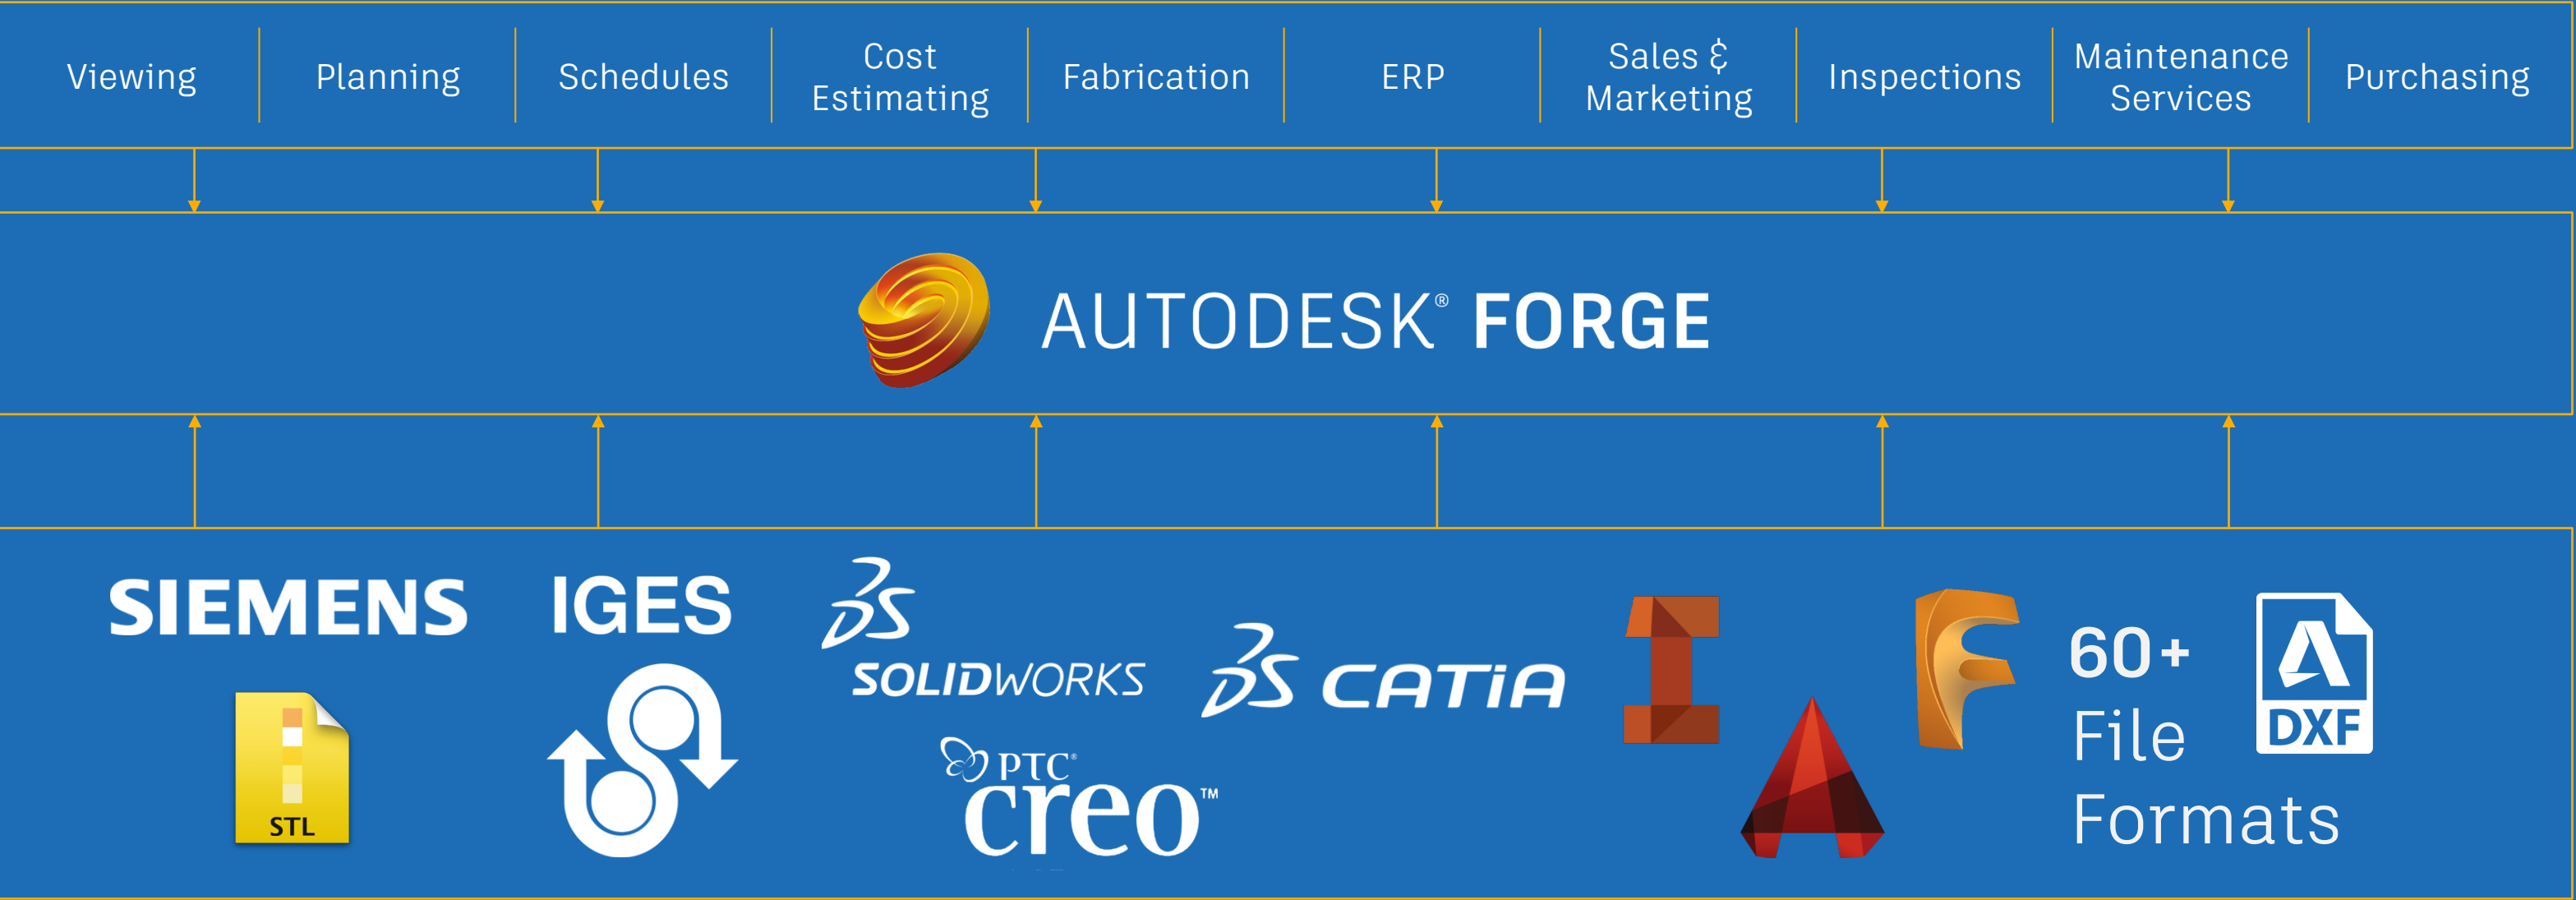

# Forge and Dasher 360

# The Forge Platform

# The Forge Platform

# The Forge Platform, today

## Data Management API **NEW**

Manage your data across A360, Fusion 360, and our native Object Storage Service.

## Model Derivative API **NEW**

Translate your design files from one format to another, prepare them for online viewing, and extract geometry data.

## Viewer **RENAMED**

Show off your design files in a web-based viewer.

## Design Automation API **RENAMED**

Run scripts on your design files at cloud scale.

## OAuth **NEW FEATURES**

Open standard used across the Forge Platform for token-based authentication and authorization.

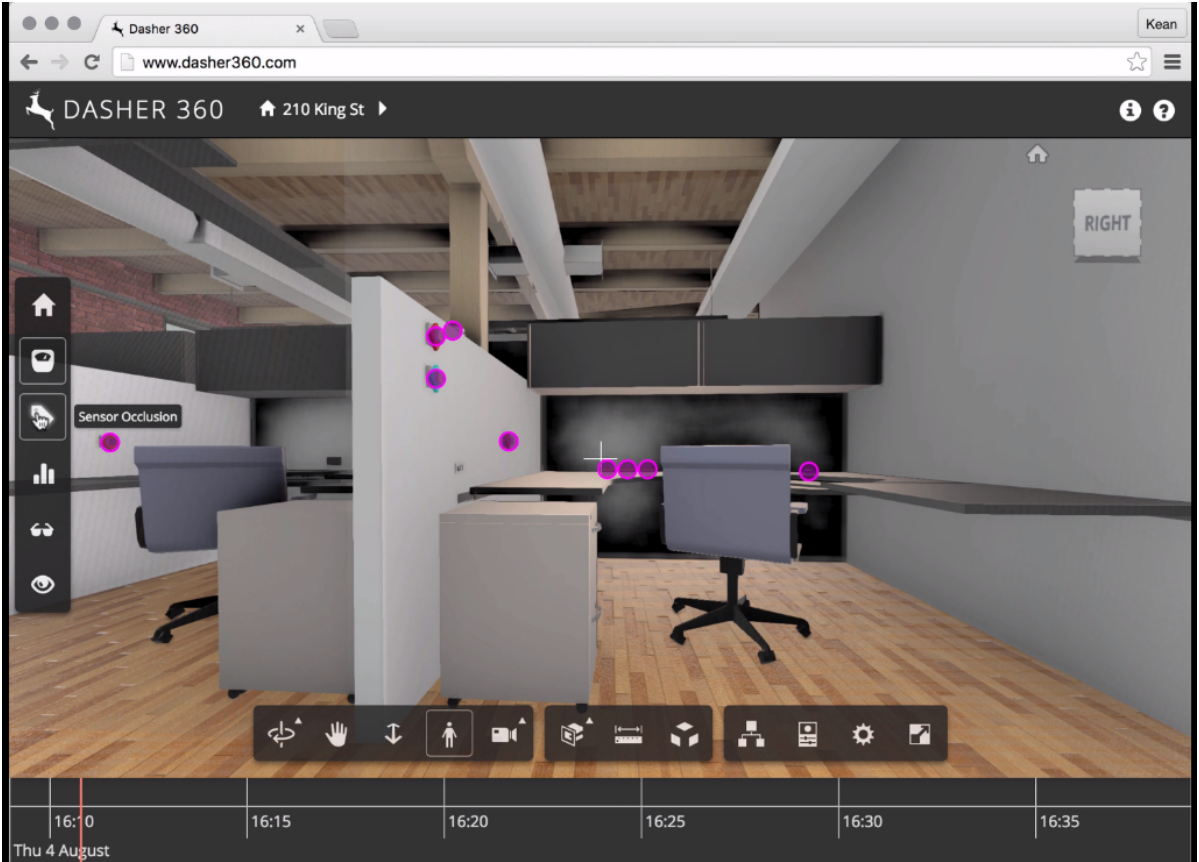

## 3D Print API **BETA**

Prepare design files for 3D printing, manage printers, and more.

# Moving to Forge

**Dasher Desktop**  
desktop software prototype

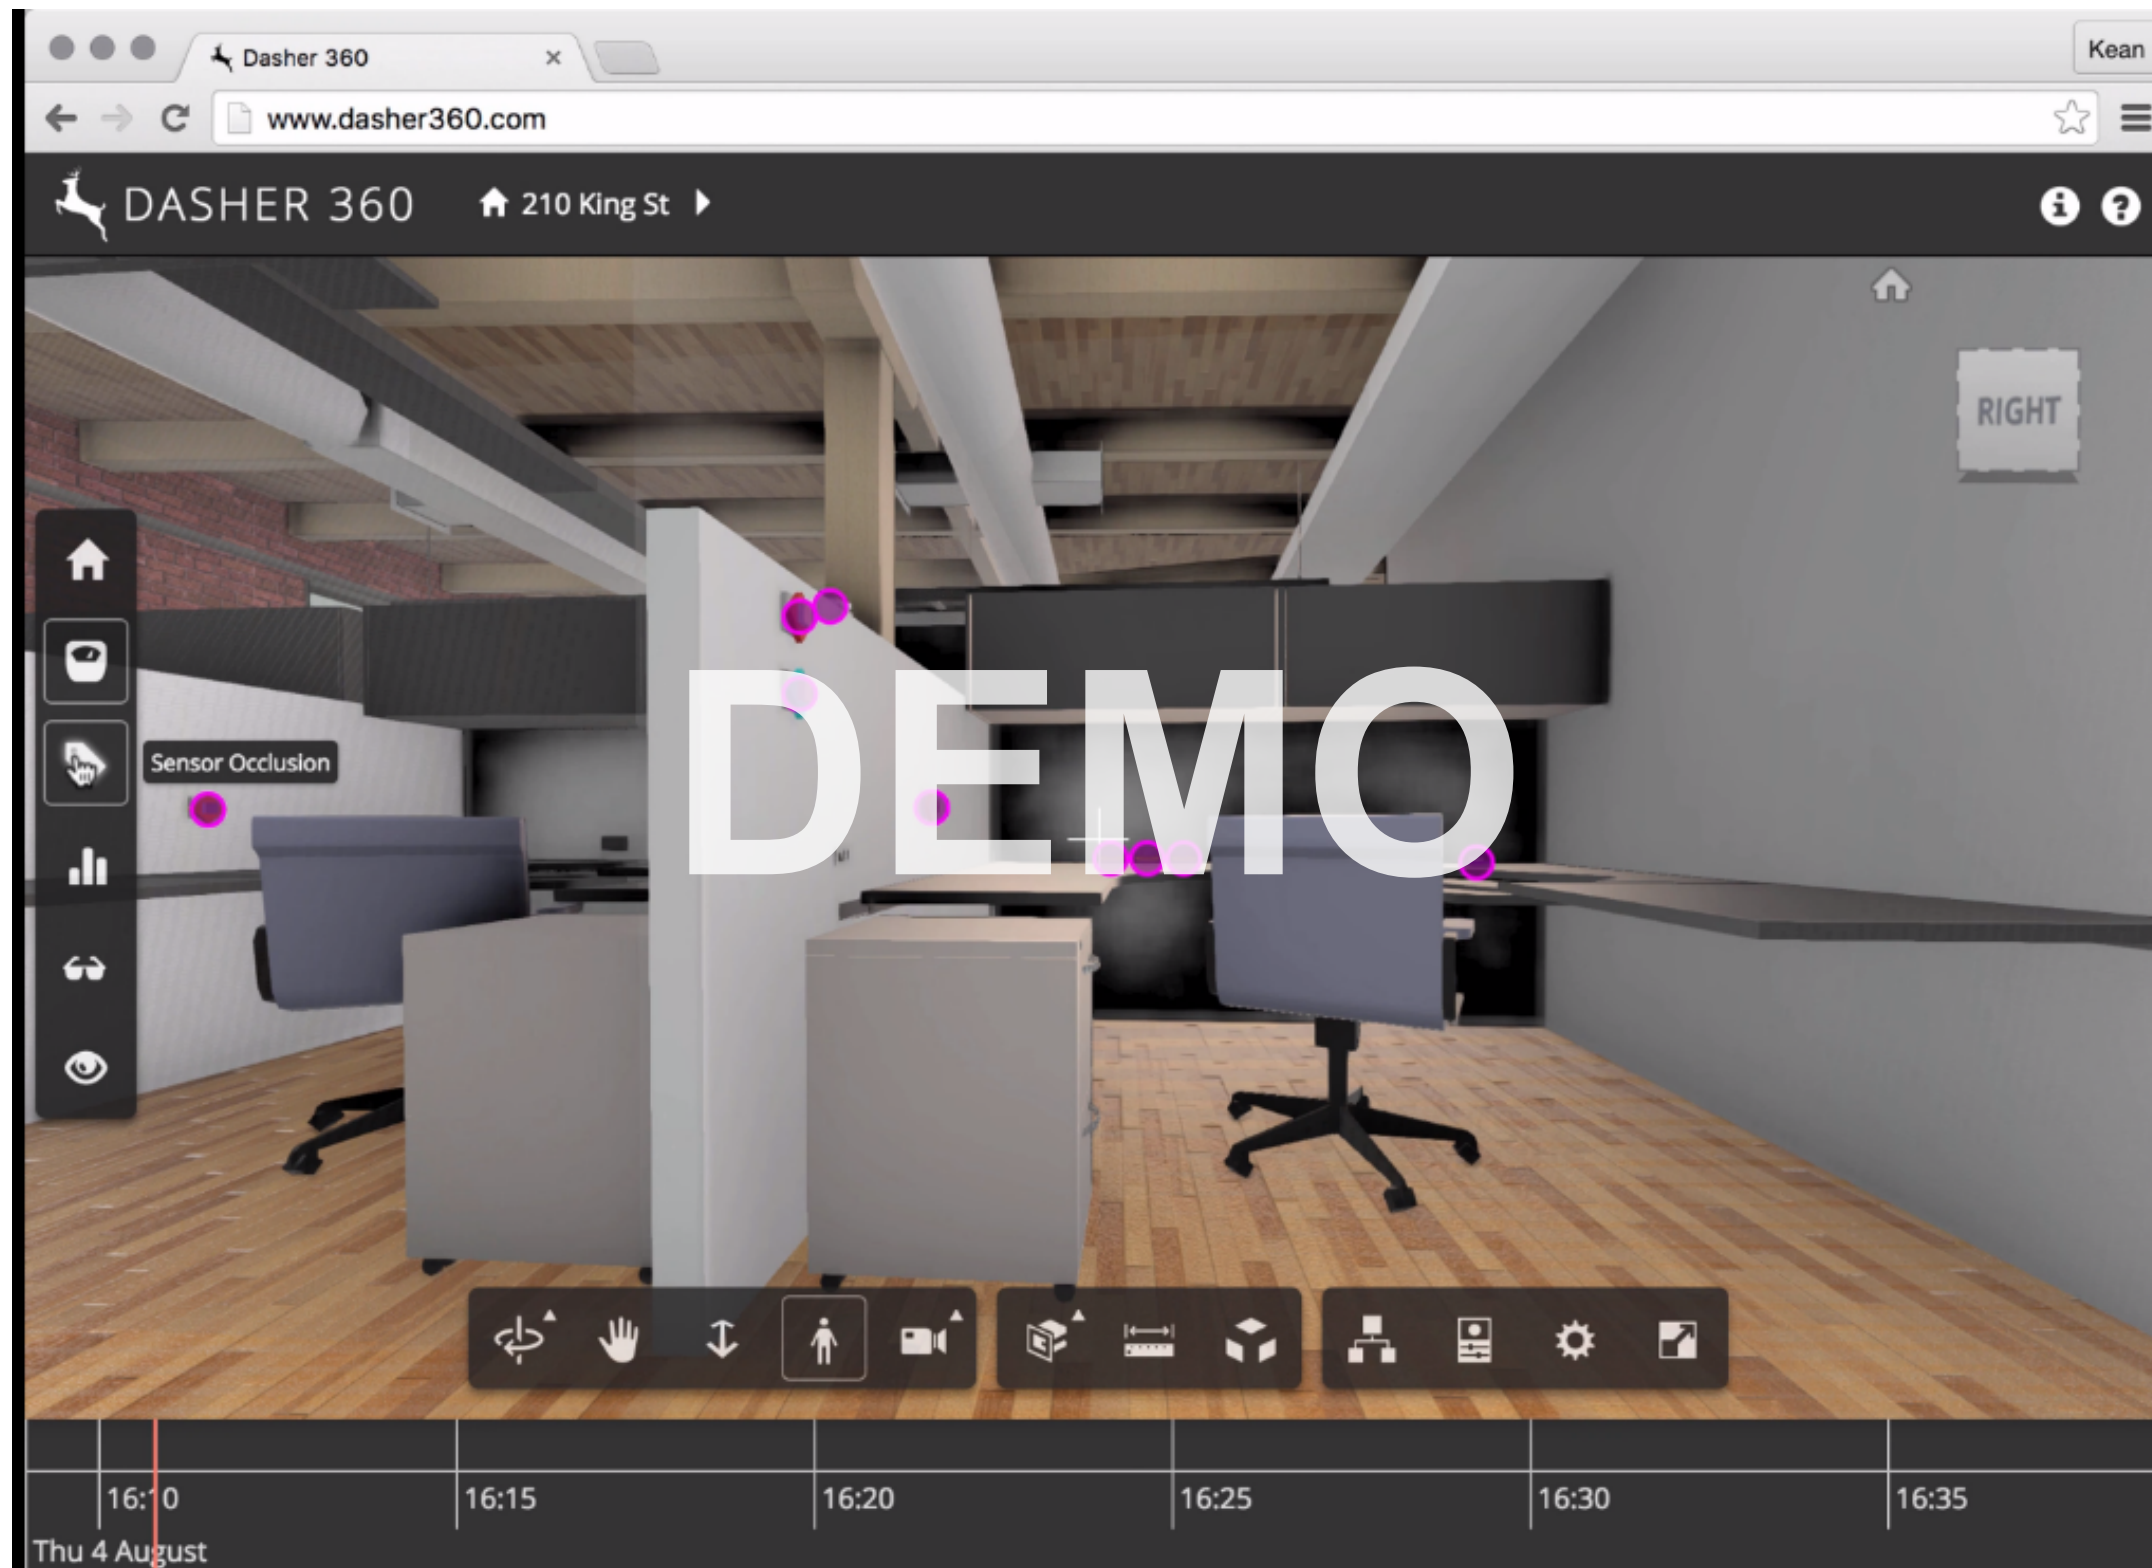

**Dasher 360**  
Dasher functionality in the web browser

# Re-thinking Dasher for the web

- *Phase 1*
  - Use the Viewer to integrate sensors with BIM
    - Prototype surface shading and advanced visualization
- *Phase 2*
  - Integrate more Forge APIs & add sensor management
- *Phase 3*
  - Beyond BIM & replicate Dasher feature-set
- *Phase 4*
  - Historical → predictive

dasher360.com

# Using Forge in your own IoT applications

# How we've used Forge for Dasher 360 (Phase 2)

- Forge Viewer
  - Advanced 3D viewing, lots of great samples
- Data Management API
  - Access models on Collab for Revit & Fusion 360
- Model Derivative API
  - Translate models and allow public sharing
- OAuth
  - 3-legged for DM API, 2-legged for sharing

# Forge Viewer

- Feature-rich, WebGL/THREE.js-based viewer
  - Geometry isolation, sectioning, first-person, VR
- Helpful samples
  - Sensor dots & extension framework
    - <https://github.com/Developer-Autodesk/library-javascript-viewer-extensions>
  - Surface shading
    - [https://github.com/timoxley/threejs/blob/master/examples/webgl\\_shader2.html](https://github.com/timoxley/threejs/blob/master/examples/webgl_shader2.html)

# Data Management API

- REST API allowing you to access models
  - On Collaboration for Revit & Fusion 360
    - Technology formerly known as A360
- The user logs in with their own credentials
  - Uses 3-legged authentication
  - The application can browse a user's hubs/projects
    - Close link to the Model Derivative API

# Model Derivative API

- REST API allowing you to translate models
  - For viewing via the Forge Viewer
  - Into downstream, derivative formats such as OBJ
- Also provides access to metadata
  - Formerly only available in the Viewer
  - Can be used to create non-graphical tools

# Accessing Data 360

# Populating Data 360

- Databases need data...
- Use the REST API to send data across
  - Conduits can federate data from existing systems
- The Programmable Data Router
  - Raspberry Pi-based system
  - Simplifies sensor connection and API usage

# Reading from Data 360

- Our simplified API is easiest for data access
  - <https://projectdasher-staging.api.autodesk.com/api/v1/projects/my-project-id/readings?sensorList=sensor-id&latestReading=true>
- Returns JSON containing latest sensor reading

# Using Data 360 from Dynamo

# Dynamo

- Node-based programming environment
  - Tuned for computational design for BIM

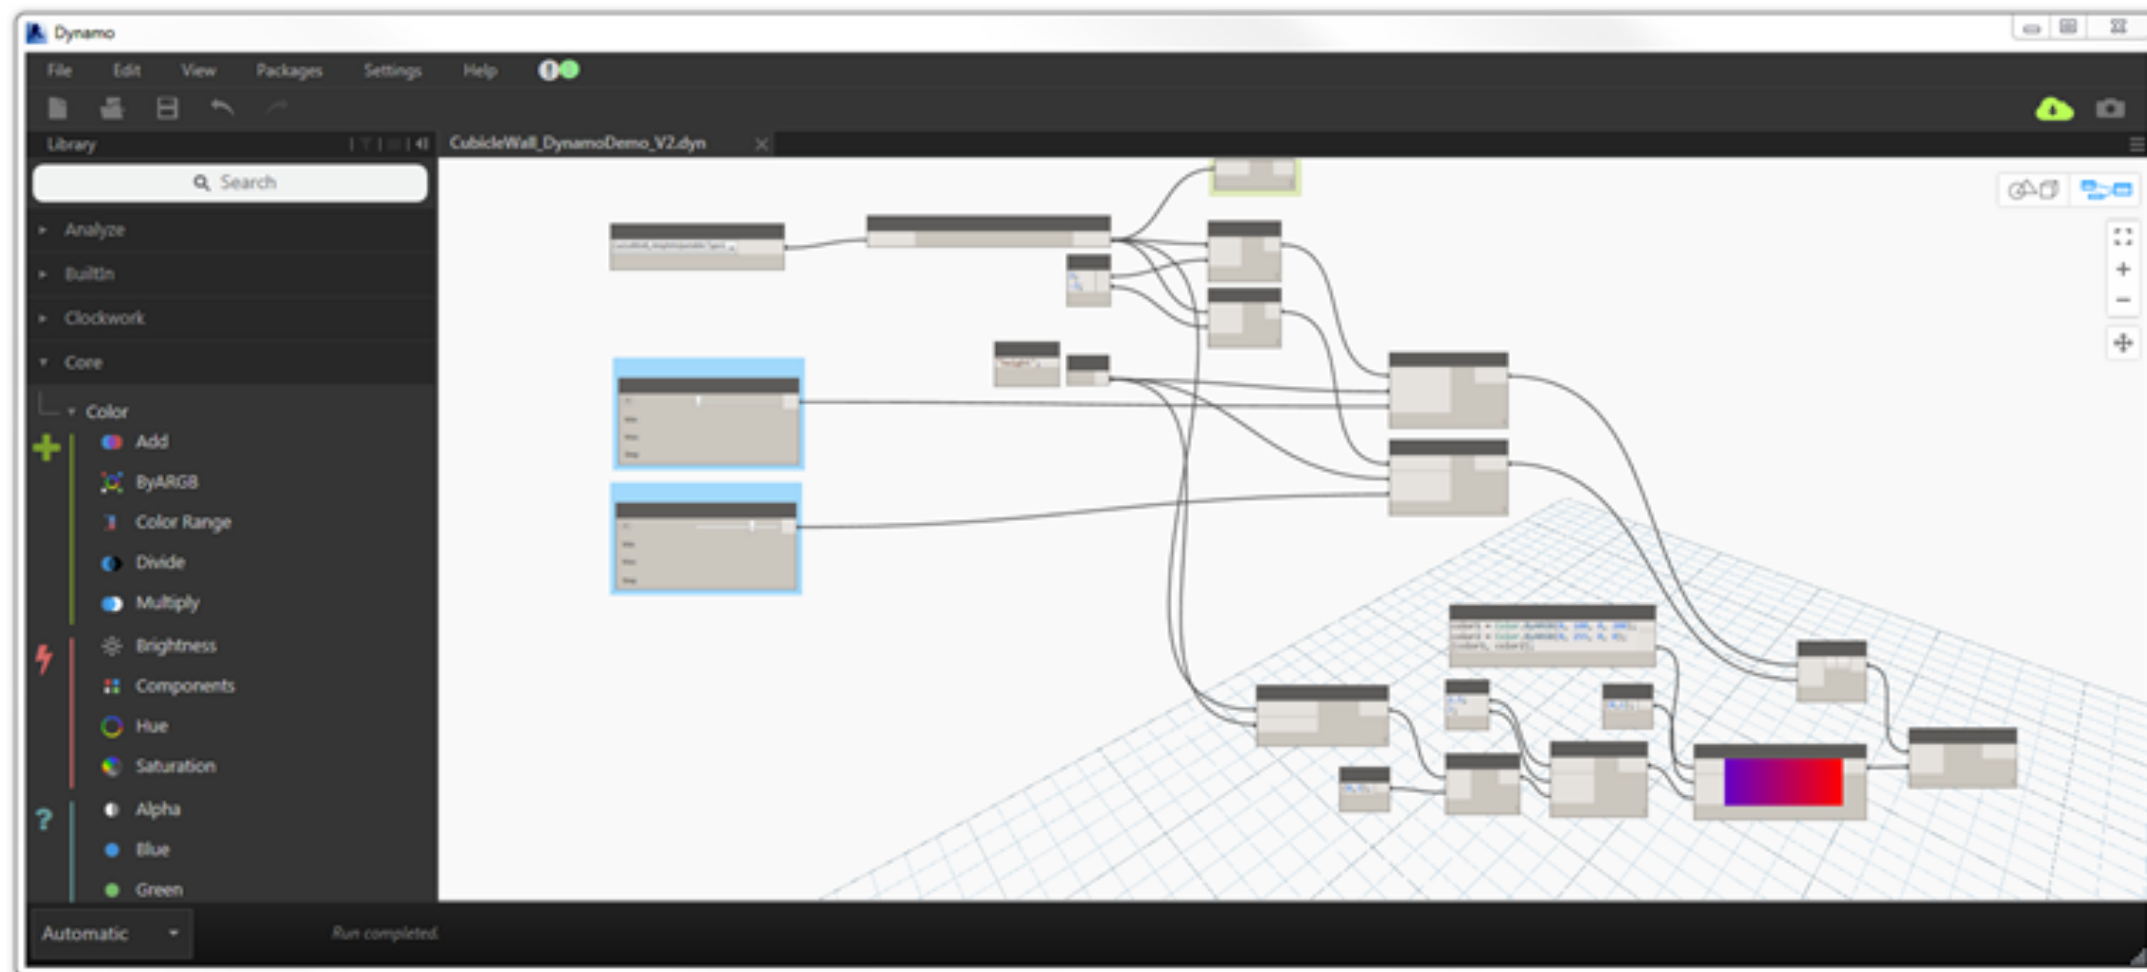

# Dynamo is a highly flexible tool

- Integrated with Revit
  - Also has a standalone version, Dynamo Studio
- You can build custom nodes in C# or Python
  - Accessing REST APIs is trivial
- Use Data 360 to drive designs based on data
  - Might be historical or real-time

# Historical data in Dynamo

- Show how past data might influence a design
  - Change the height of partitions based on sound

# Real-time data in Dynamo

- Custom Dynamo nodes can be “Periodic”
  - Which means they can be polled regularly for data
- Now for some fun...
  - Let's see how high we can raise those partitions!

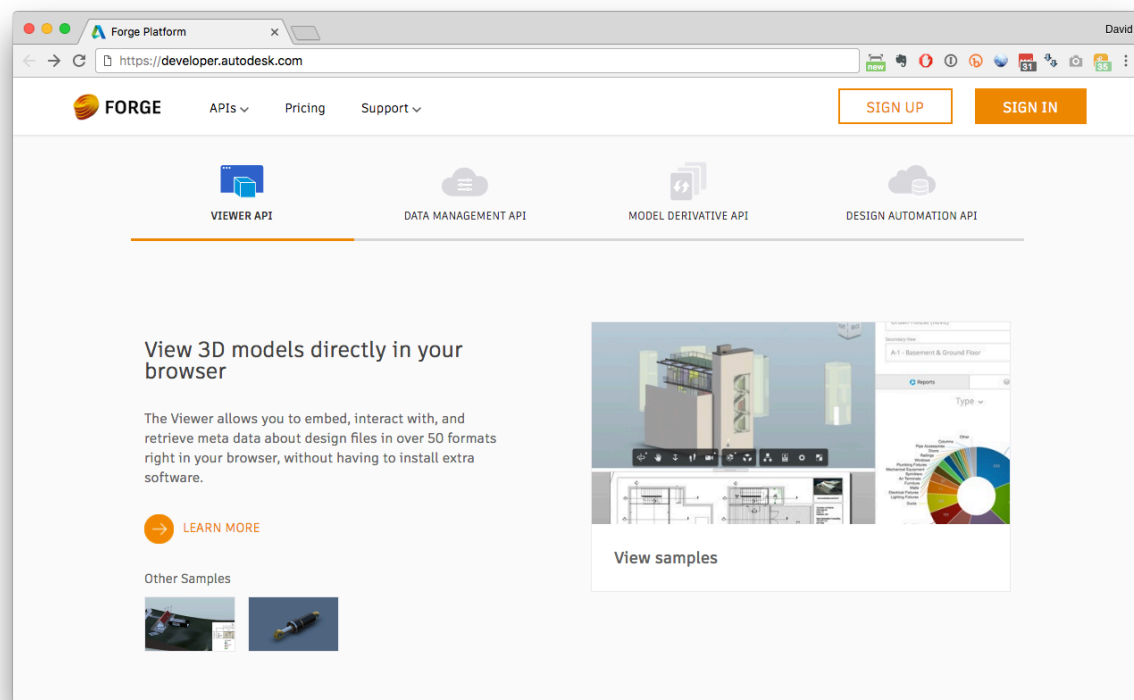

# Moving forward

# What's next?

- Private beta for Data 360
  - If interested, leave me your card or email us at [project.dasher@autodesk.com](mailto:project.dasher@autodesk.com)
- More projects with Dasher 360
- Convergence of my current areas of interest
  - 3D display of IoT data + AR/VR
  - In-context IoT data and analysis
