

A 3D simulation of a rubber molding process. The image shows a transparent, curved mold structure with a grid pattern. Inside the mold, a rubber material is being shaped. The background is dark with blue bokeh light effects.

Compression Molding Simulation of Rubber Materials

Kurt Hayden

Vice President of Engineering and Technology
Fenner Advanced Sealing Technologies
Humble, Texas

Class Summary

This class will give an overview of the compression molding of rubber including material characteristics, the processes involved and tooling considerations. Difficulties encountered during the molding of rubber will be discussed. The opportunities that simulation of rubber molding processes may provide will be considered, including the current state of these types of simulation and thoughts on future enhancements.

Learning Objectives

At the end of this class, you will be able to:

- Understand the composition and characteristics of rubber.
- Conceptualize how rubber is compression molded.
- Be aware of the difficulties of predicting the results of rubber molding.
- Consider how flow analysis can help reduce uncertainties in the development of rubber products.

Class Outline

- Background
- Material Information
- Processing Methods
- Simulation Considerations
- Example Simulations
 - Compression Molding
 - Transfer Molding
 - Bonus Round

“Rubber... But where does it come from?”

Origins

Charles Marie de La Condamine

- 1736 – Discovery in Ecuador

Joseph Priestley

- 1770 - Termed “rubber”

Charles Goodyear

- 1839 – Sulfur vulcanization

Sir Henry Wickham

- 1876 – ‘Stole’ 70,000 seeds

Natural Rubber

- Nature's best
 - Pará rubber tree (*Hevea brasiliensis*)
 - Gutta-percha (*Palaquium gutta*)
 - Dandelion (*Taraxacum officinale*)
- South American Origins
- Largest Producers
 - Thailand
 - Indonesia
 - Malaysia

Applications

- 1600 BC – Mayan Game Balls
- Leather replacement
- Clothing
- Tires
- Hoses
- Adhesives
- Drive belts

Material Characteristics

The Basics

- It's a Polymer
- Thermoplastic v. Thermoset
- Elastomer
 - How much deformation?
 - 100% reversible
 - 300% reversible
 - 5-700% reversible
 - Up to 1000%

Keep in Mind

- Polymeric nature
- Molecular weight

Isoprene

+

Isoprene

catalysts

Polyisoprene (natural rubber)

Important

- Polymeric nature
- Molecular weight
- Viscoelastic effects
- Cross-linking

Rubber compounding

Why not pure rubbers?

- Cost
- Properties improvement
 - Mechanical
 - Abrasion resistance
 - Chemical resistance
 - Environmental
- Processability

Typical simple recipe for tire compound

Ingredients	PPH	Function
SBR 1502, synthetic rubber	80	Rubber
SMR 20, natural rubber	20	Rubber
N299 carbon black	60	Reinforcing agent
Naphthenic oil	10	Processing oil
6PPD (phenylene diamine antiozonant)	3	Antidegradant
TMQ (antioxidant)	1	Antidegradant
Wax blend	2	Antidegradant
Stearic acid	1	Activator
Zinc oxide	4	Activator
TBBS	1.2	Accelerator
Sulfur	2.5	Vulcanizing agent

Physical properties

Typical Properties for Selected Rubber Compounds

Property	ASTM method	VMQ	NBR	EPDM	HNBR	FKM	FEPM	FFKM
Hardness, A	D-2240	30-90	50-95	50-90	60-95	65-95	75-95	70-95
Tensile, PSI	D-412	1200	2700	2700	4200	2800	3500	2800
Elongation, %	D-412	370	390	170	150	110	150	150
M100, PSI	D-412	340	610	1500	2800	2500	2800	2500
M50, PSI	D-412	240	300	620	1200	1400	1200	1400
General Cost	US\$/Lb	5	3	3	10	15	25	2000
General Cost	US\$/in ³	.22	.13	.12	.43	1.03	1.73	144.00

Processing

Industrial Processing Methods

- Compression Molding
 - Minimal “flow”
 - Isostatic
 - Mandrel Wrap
- Transfer Molding
 - True material flow
 - More “work” to the material
- Injection Molding
 - Considerable material flow
 - High Volume

Manufacturing Process Steps

- Mixing
- Milling
- Preforming
- Molding
- Post-Cure

Milling

- Done Right
 - “Energize”
 - Compresses
 - Warms
 - Dispersion
- Can be done wrong
 - “Nerve-y” material
 - Scorched material

Preforming – Die Cut

- Handcutting
- Clicker dies
- Cut-to-length extrudate

Preforming - Extrusion

- Pigs!
- Barwell v. Screw
- Die design
- Cutoff methods

Preforms - Extruded

- Sized to cavity
- Constant cross section
- Weight is best
- Generally cut to length

The Compression Mold

- Plate locating
- Pry tabs
- Cavity
- Overfill
 - Flash grooves
 - Spew grooves
 - Overfill grooves
 - Tear strips

The Compression Mold

- Plate locating
- Pry tabs
- Cavity
- Overfill
 - Flash grooves
 - Spew grooves
 - Overfill grooves
 - Tear strips

The Compression Mold

- Plate locating
- Pry tabs
- Cavity
- Overfill
 - Flash grooves
 - Spew grooves
 - Overfill grooves
 - Tear strips

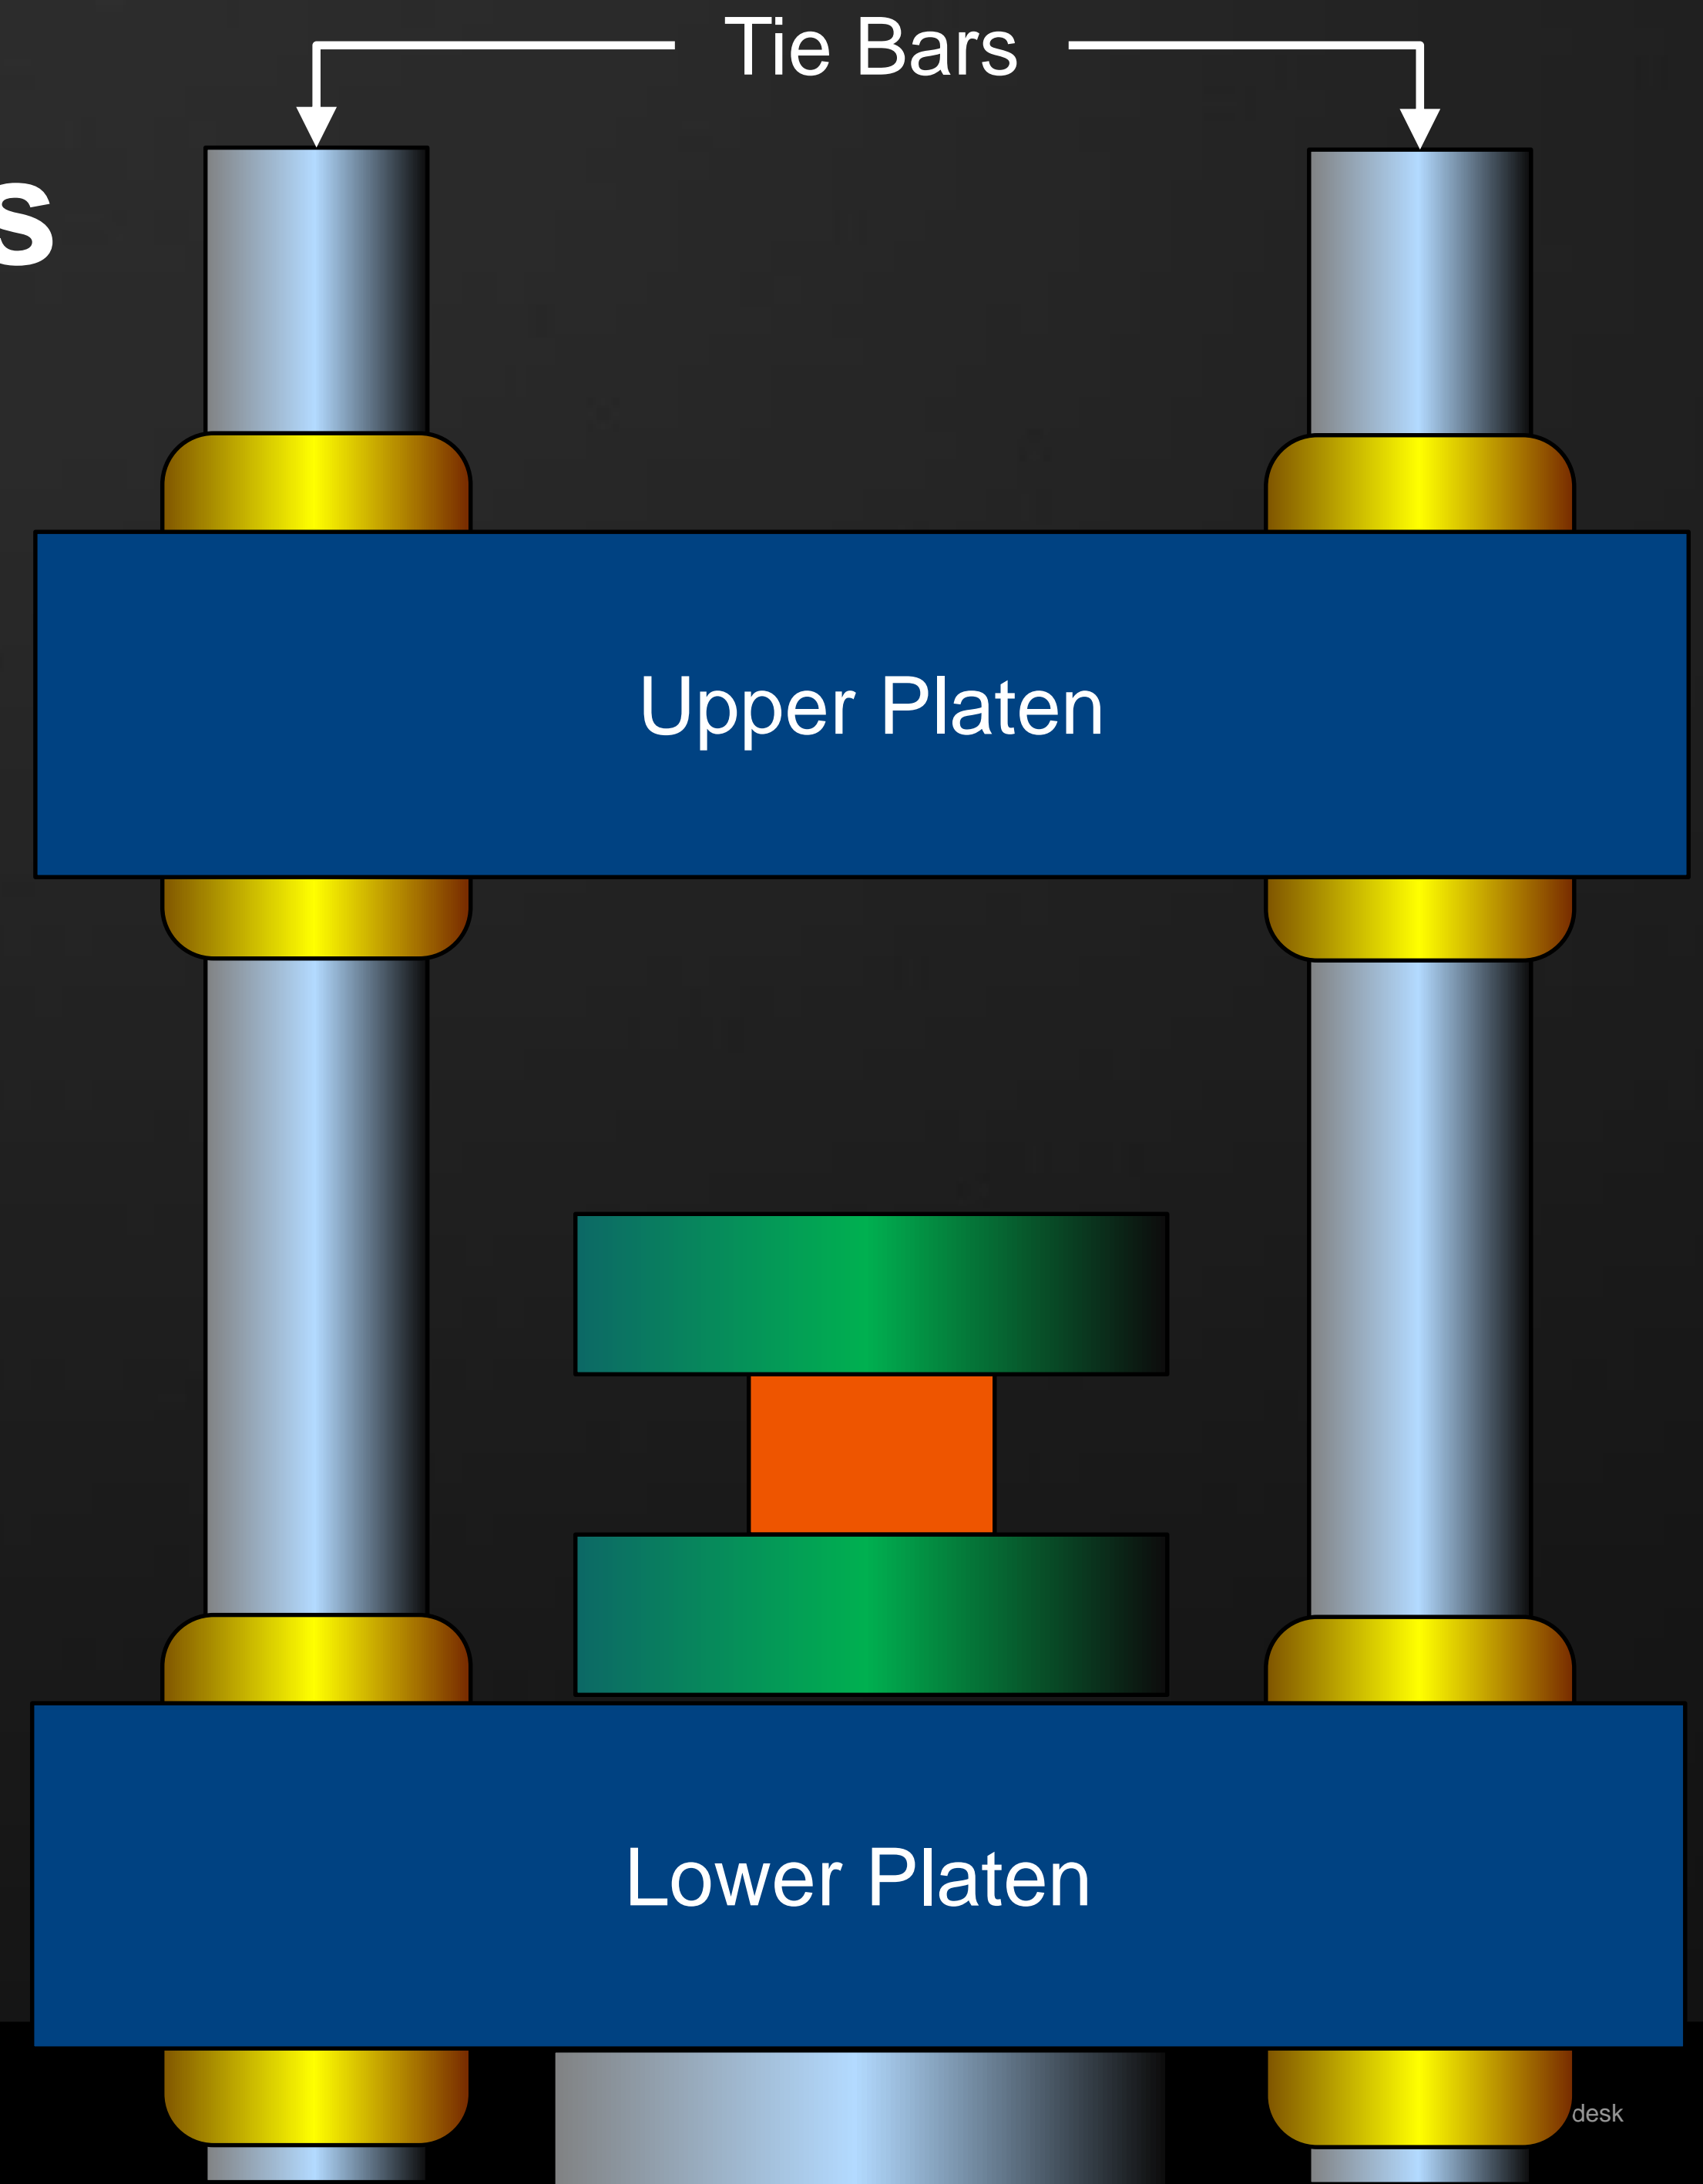

The Compression Mold

- Plate locating
- Pry tabs
- Cavity
- Overfill
 - Flash grooves
 - Spew grooves
 - Overfill grooves
 - Tear strips

Compression Molding Press

- Components
 - Tie bars
 - Platens
 - Hydraulic cylinder(s)

Compression Molding Press

- Components
 - Tie bars
 - Platens
 - Hydraulic cylinder(s)

Compression Molding Press

- Components
 - Tie bars
 - Platens
 - Hydraulic cylinder(s)

Compression Molding Press

- Components
 - Tie bars
 - Platens
 - Hydraulic cylinder(s)
- Controls
 - Pressure
 - Temperature
 - Timers
 - Bumps
 - Speed

Transfer Molding Press

- Two Methods
 - By the mold
 - Transfer pot
 - Sprues & gates
 - By the press
 - Pot on the machine
 - Note the cylinder on top

Molding Cycle

- Preheating
- Cleaning
- Release
- Loading
- Pressing & Curing
- Unloading

The Shot

- Part (cavity)
- Flash Rings

Post Cure Process

- Forced air oven
- Programmed cycle
 - Times
 - Temperatures
- Optimizes crosslinking
- Removes volatiles
- Dimensional issues

Trimming

- Before or After Post-cure
- Manually
 - Knife
 - Sandpaper
- By machine
 - Die cut
 - Buffing wheel
 - Shot blasting
 - Cryogenics deflashing

Considerations for Simulation

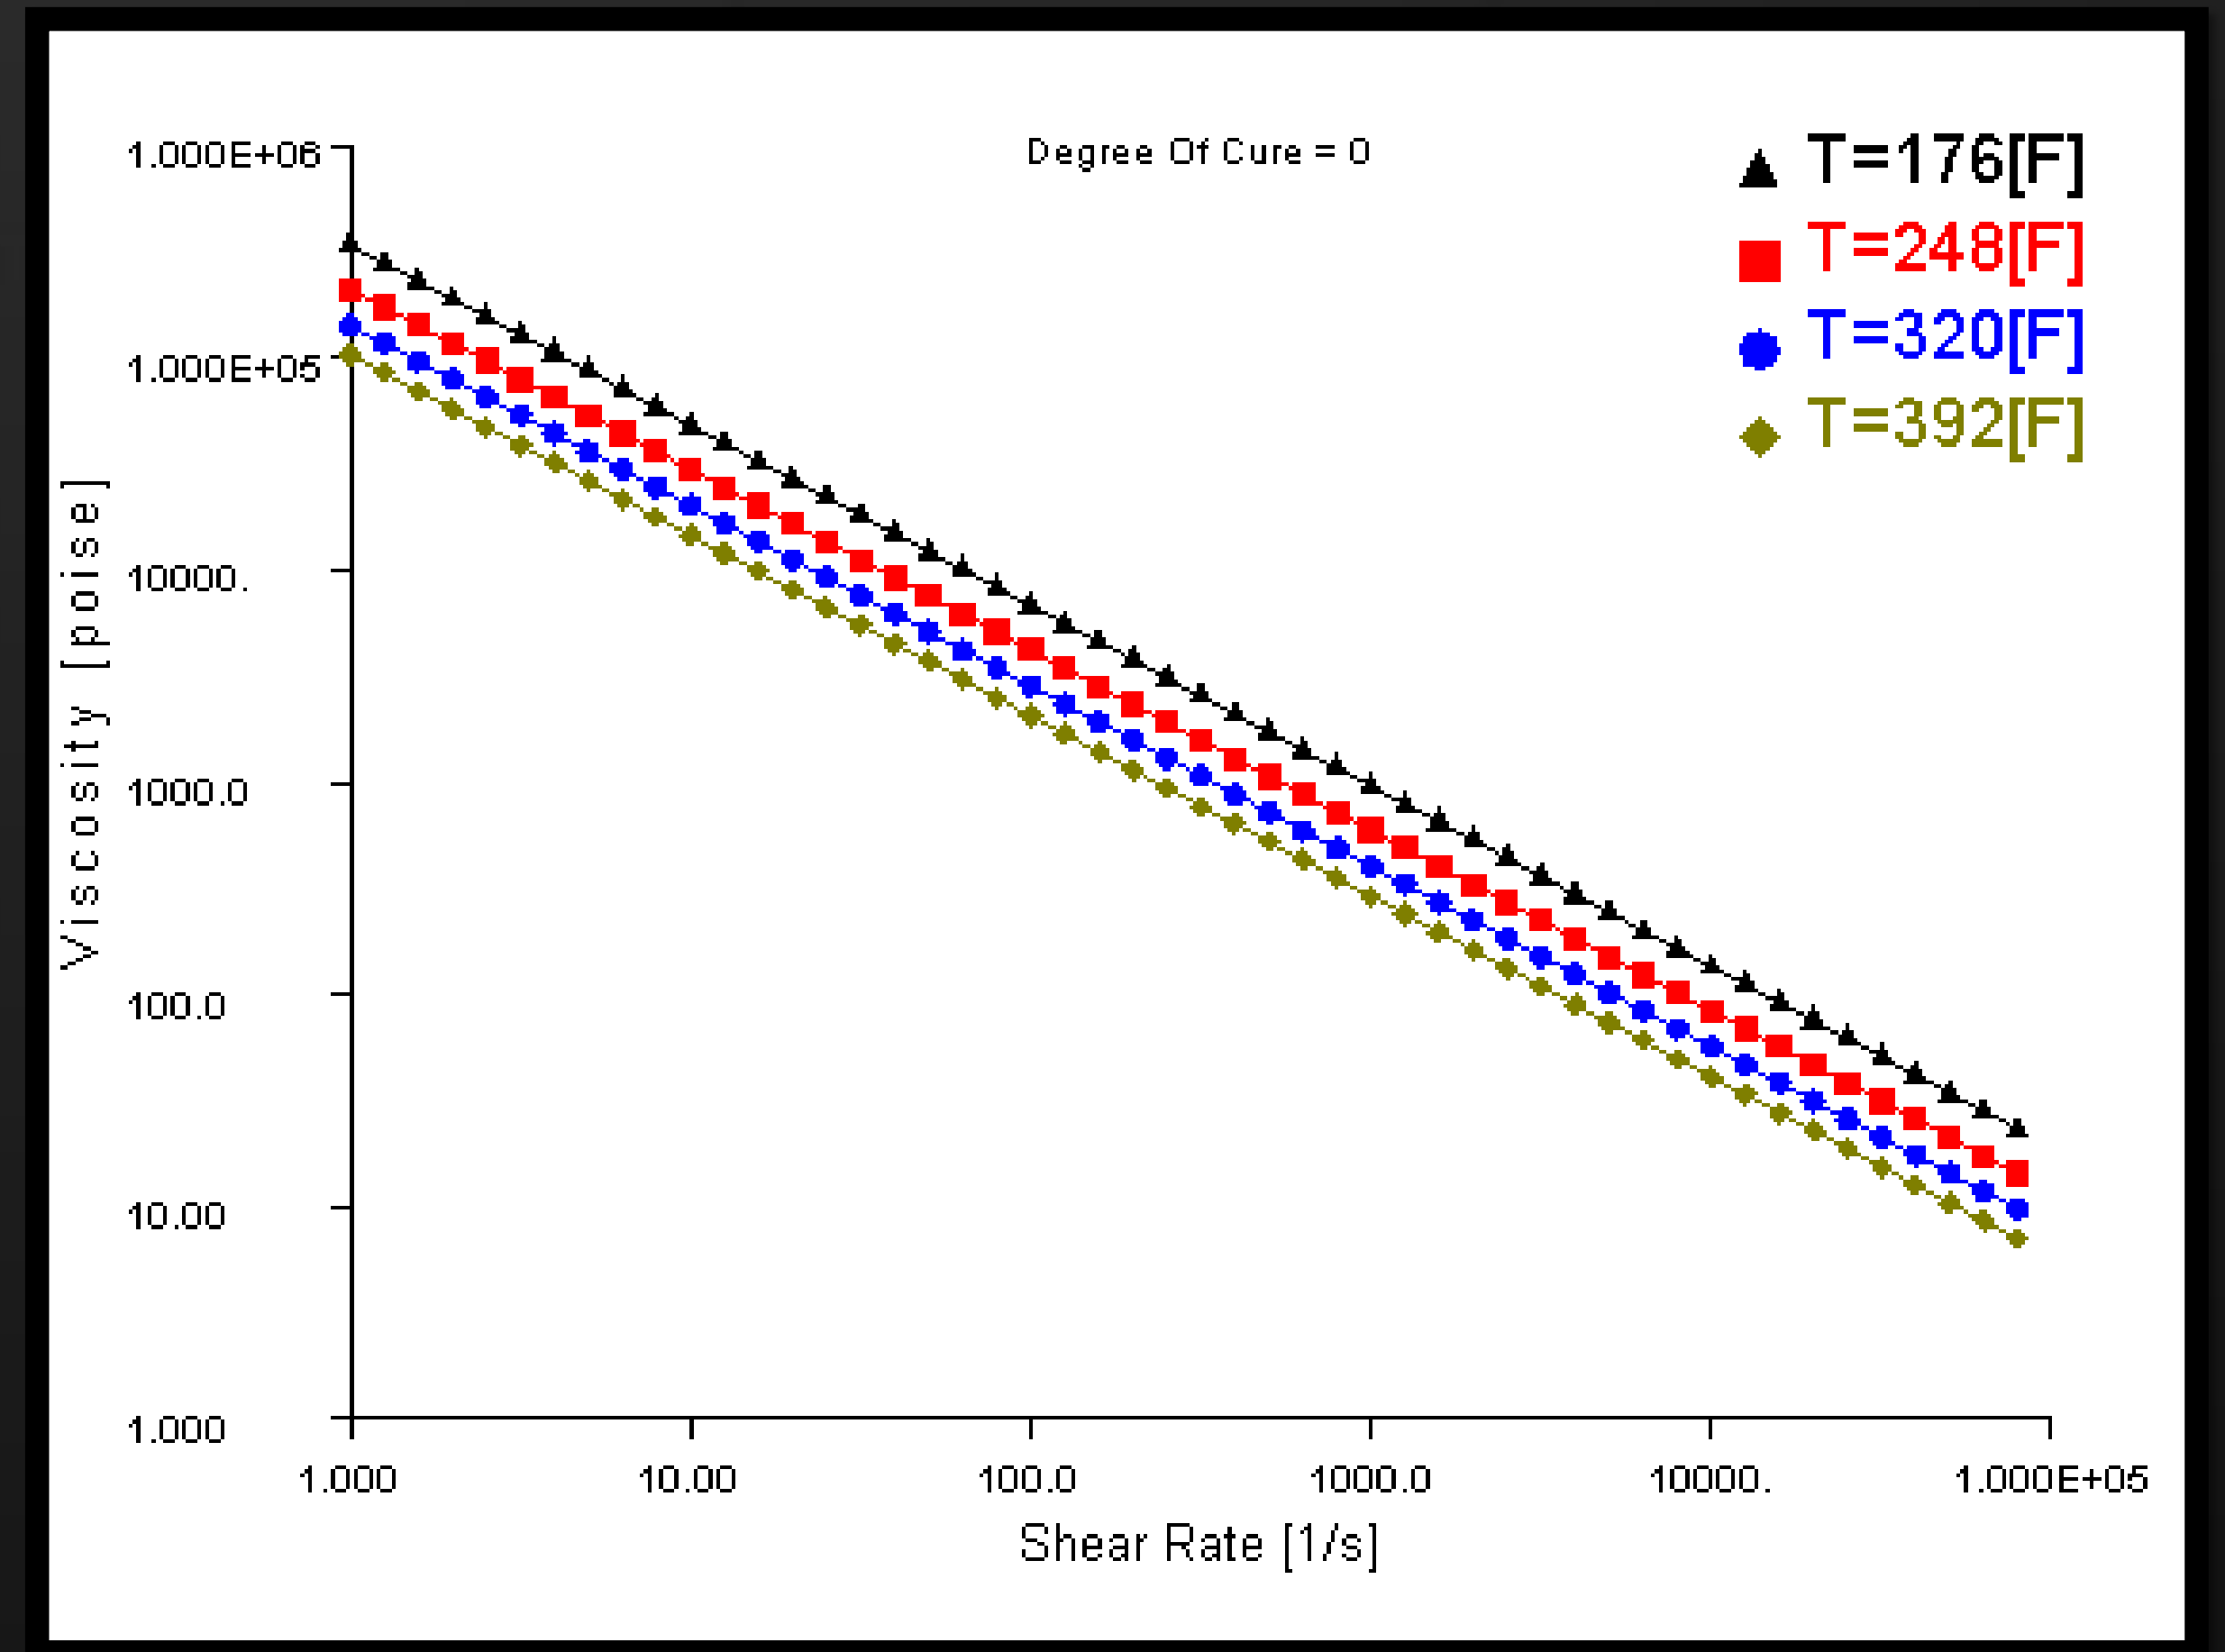

Compression Simulation

- Through a mirror... darkly
- Adapting reality
- Constraints
 - Material data
 - Process model

Material Data

- Rheological properties
 - Multiple temperatures
 - Multiple shear rates
 - Degree of cure
- Physical properties
 - PVT - cure
 - Thermal conductivity
- Curing kinetics
 - DCS curves
 - Kamal's model

Adapting the Part to Model

- Spring energized seal
- Application:
 - 22,000 psi
 - 482°F
 - Dynamic (minimally)
- Endless ring preform
- FEPM – AFLAS®

The Model

- Components
 - Cavity
 - Flash ring
 - Overfill groove
- Tetrahedral mesh
- For transfer molding
 - Transfer pot
 - Sprues

The Preform

Practical:

- Size by weight
- Size by shape

Simulation:

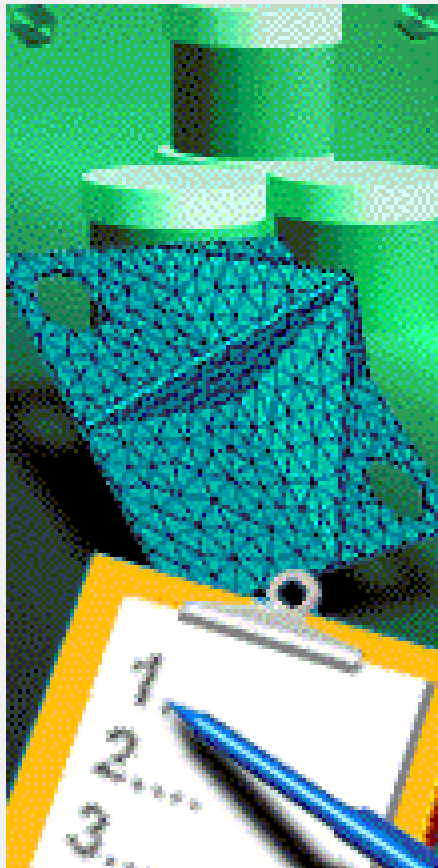

- Size by volume
 - Fill Cavity
 - Partial fill of overfill grooves

Adapting the Process

- Mold temperature
- Preform temperature

Process Settings Wizard - RIM Settings - Page 1 of 3

Mold surface temperature C

Melt temperature C

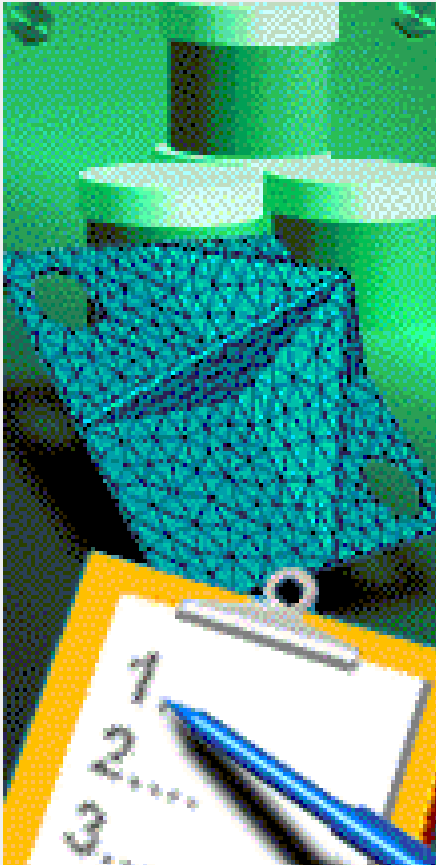

☒ Fiber orientation analysis if fiber material

[Fiber Solver Parameters...](#)

Adapting the Process

- Mold temperature
- Preform temperature
- Initial cure
- Cure time

Process Settings Wizard - Reactive Molding Settings - Page 2 of 3

Melt initial conversion	0	[-1:1]
Curing time	10	s [0:]
%Air mass	0	% [0:0.01]

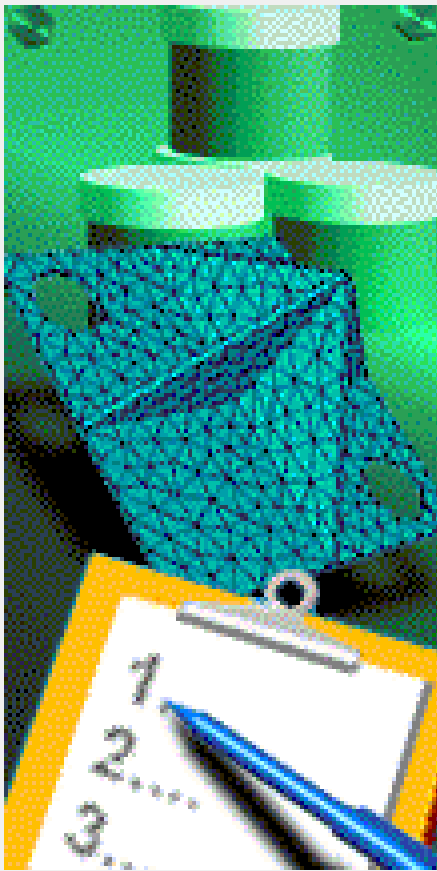

Preconditioning analysis

No preconditioning analysis ▼

Adapting the Process

- Mold temperature
- Preform temperature
- Initial cure
- Cure time
- Close time
- Pressing force
- Pressing speed

Process Settings Wizard - Compression Settings - Page 3 of 3

Compression direction: -Z

Pure compression press open distance option: Automatic

Press compression time: 1200 s [0:1200]

Press speed cap: 1000 mm/s (0:10000)

Press compression force cap: 150 tonne (0:70002.2)

Press compression speed vs distance (compression is along z-axis)

	Distance mm [0:5000]	Press compression speed mm/s [0:1000]
1	0.1	10
2	1	10
3		
4		

Switch to press force control: When the press force reaches compression force cap

Compression force after switch to press force control: Relative to the value at switch over [Edit values...](#)

External initial charge option: Rigid charge with automatic offset

Extra initial compression volume percentage: 0 % [0:5] [Advanced options...](#)

Simulation Examples

Compression Molding

- Mold Cavity
- Overfill Geometry
- Preform

Filling

- Preform in-place
- Mold closing
- Filling of overfill (flash) grooves

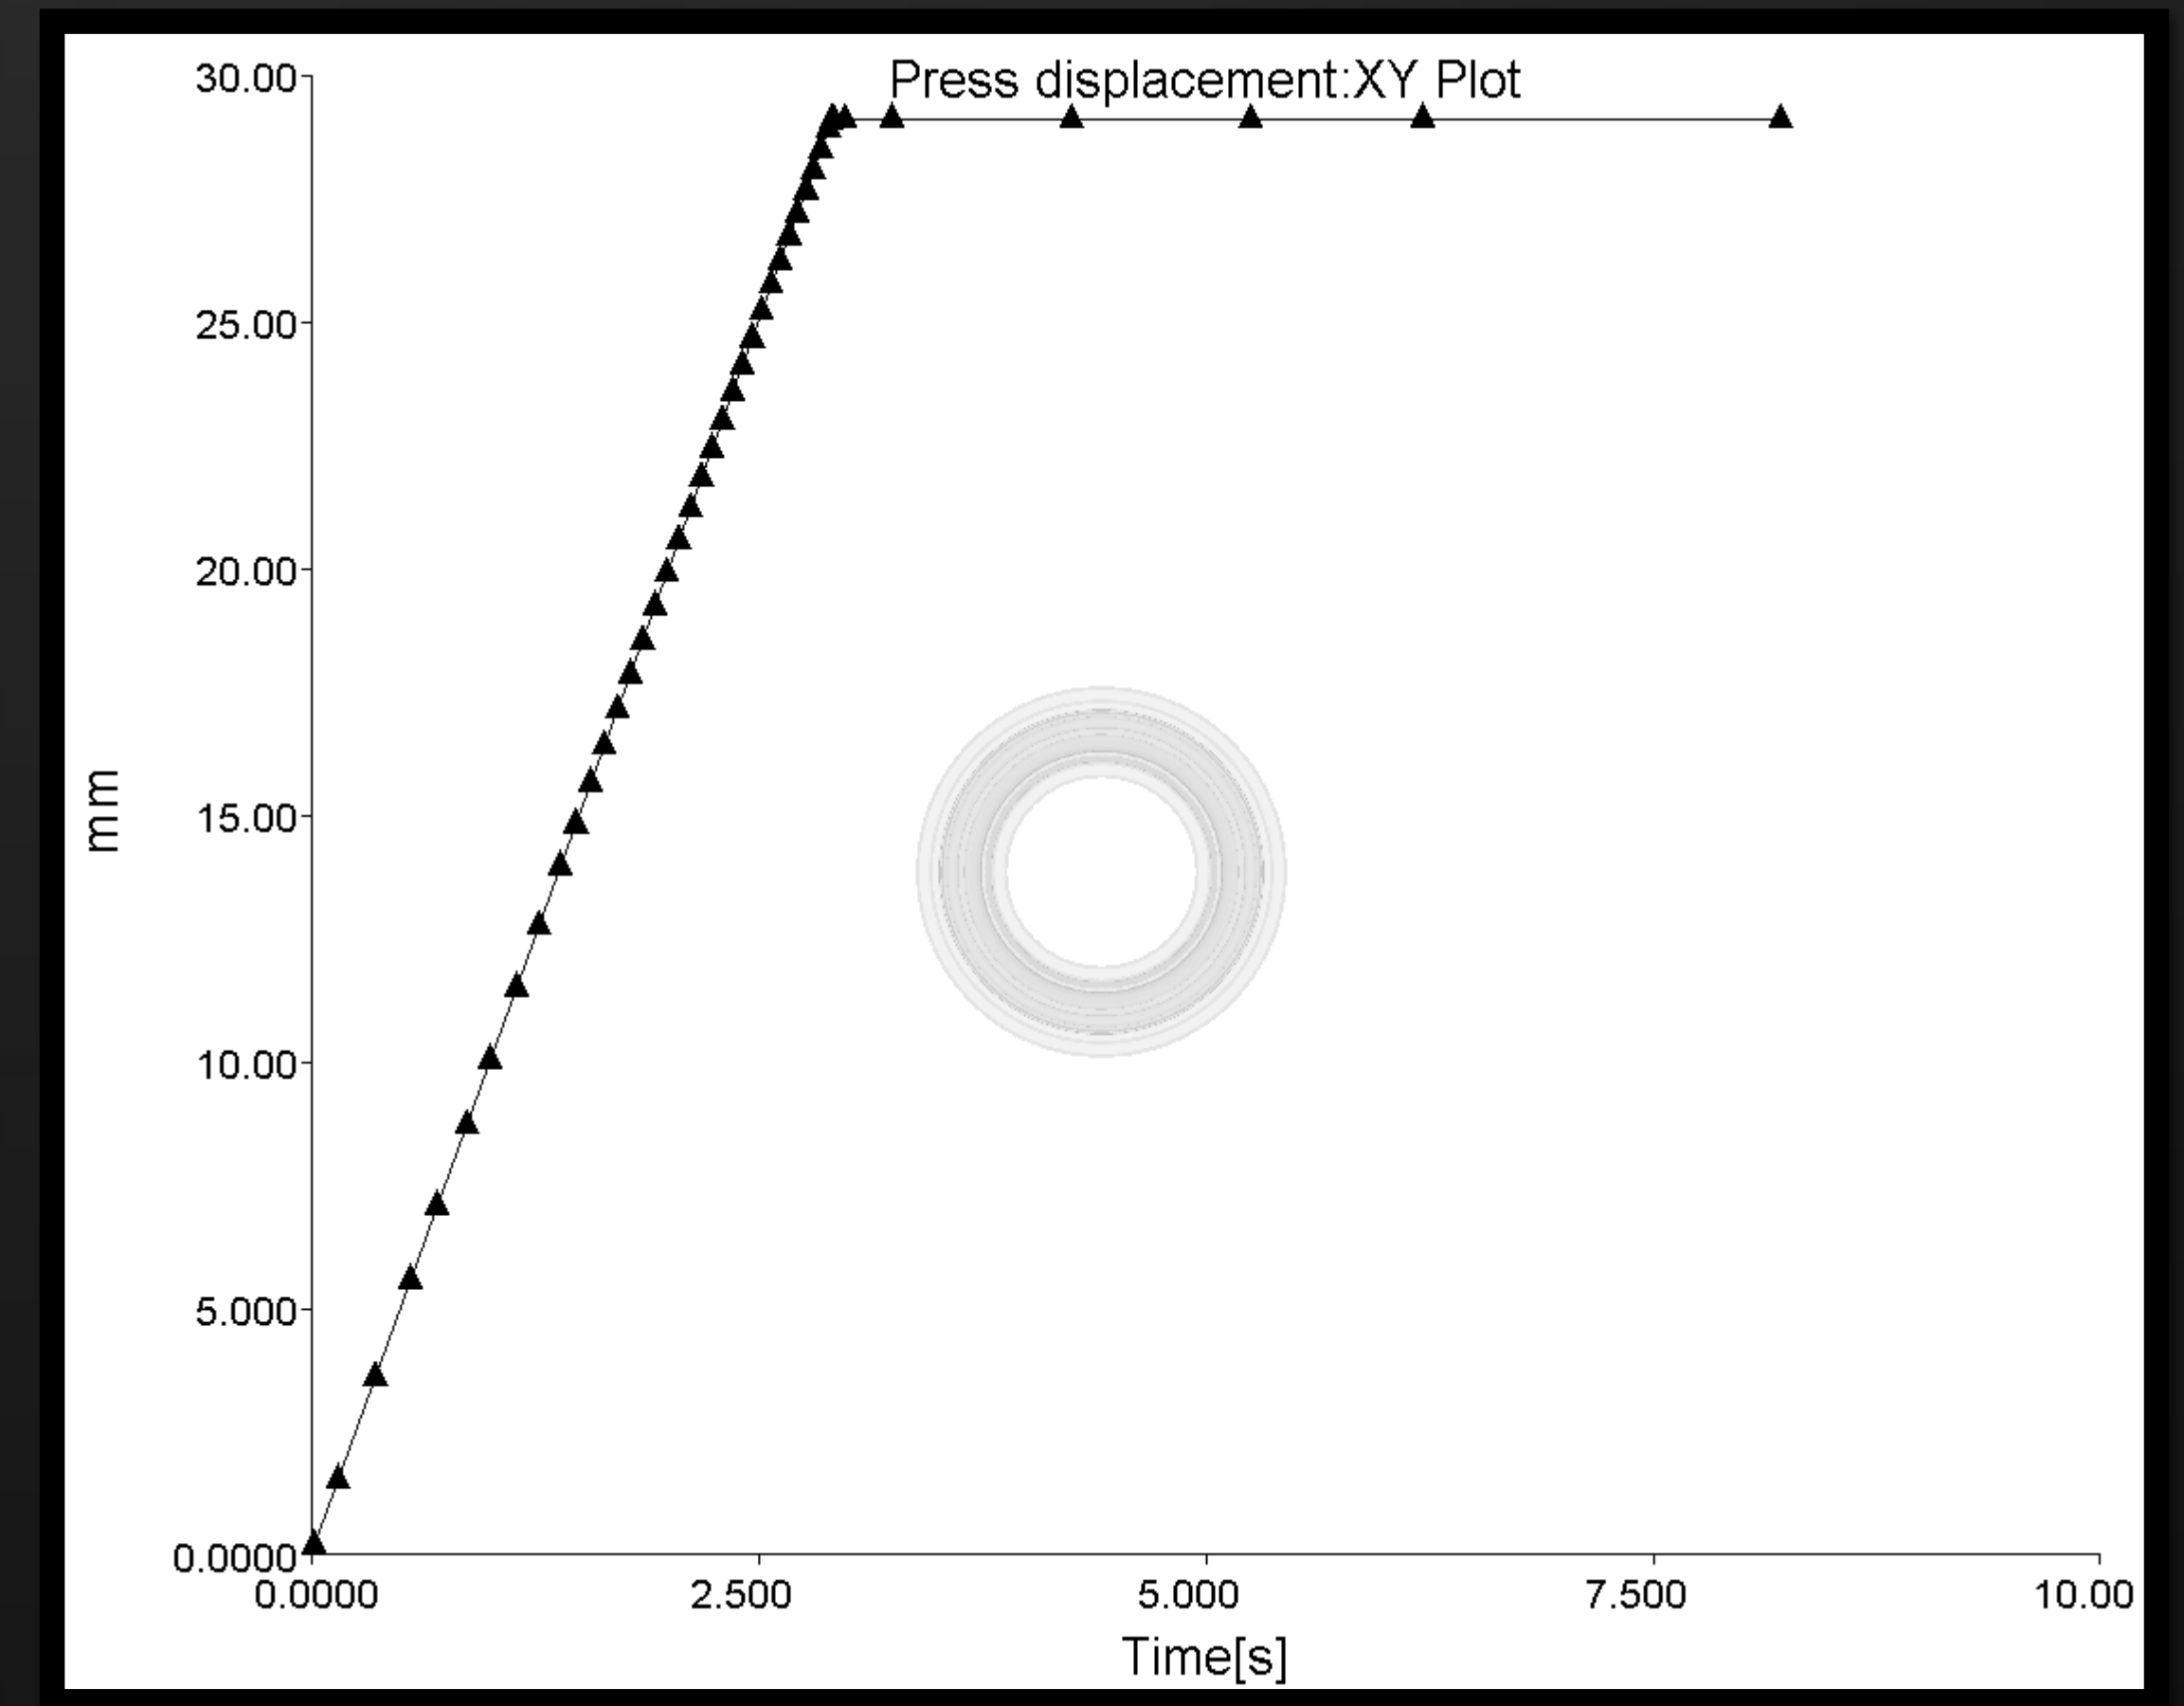

Filling – Animation

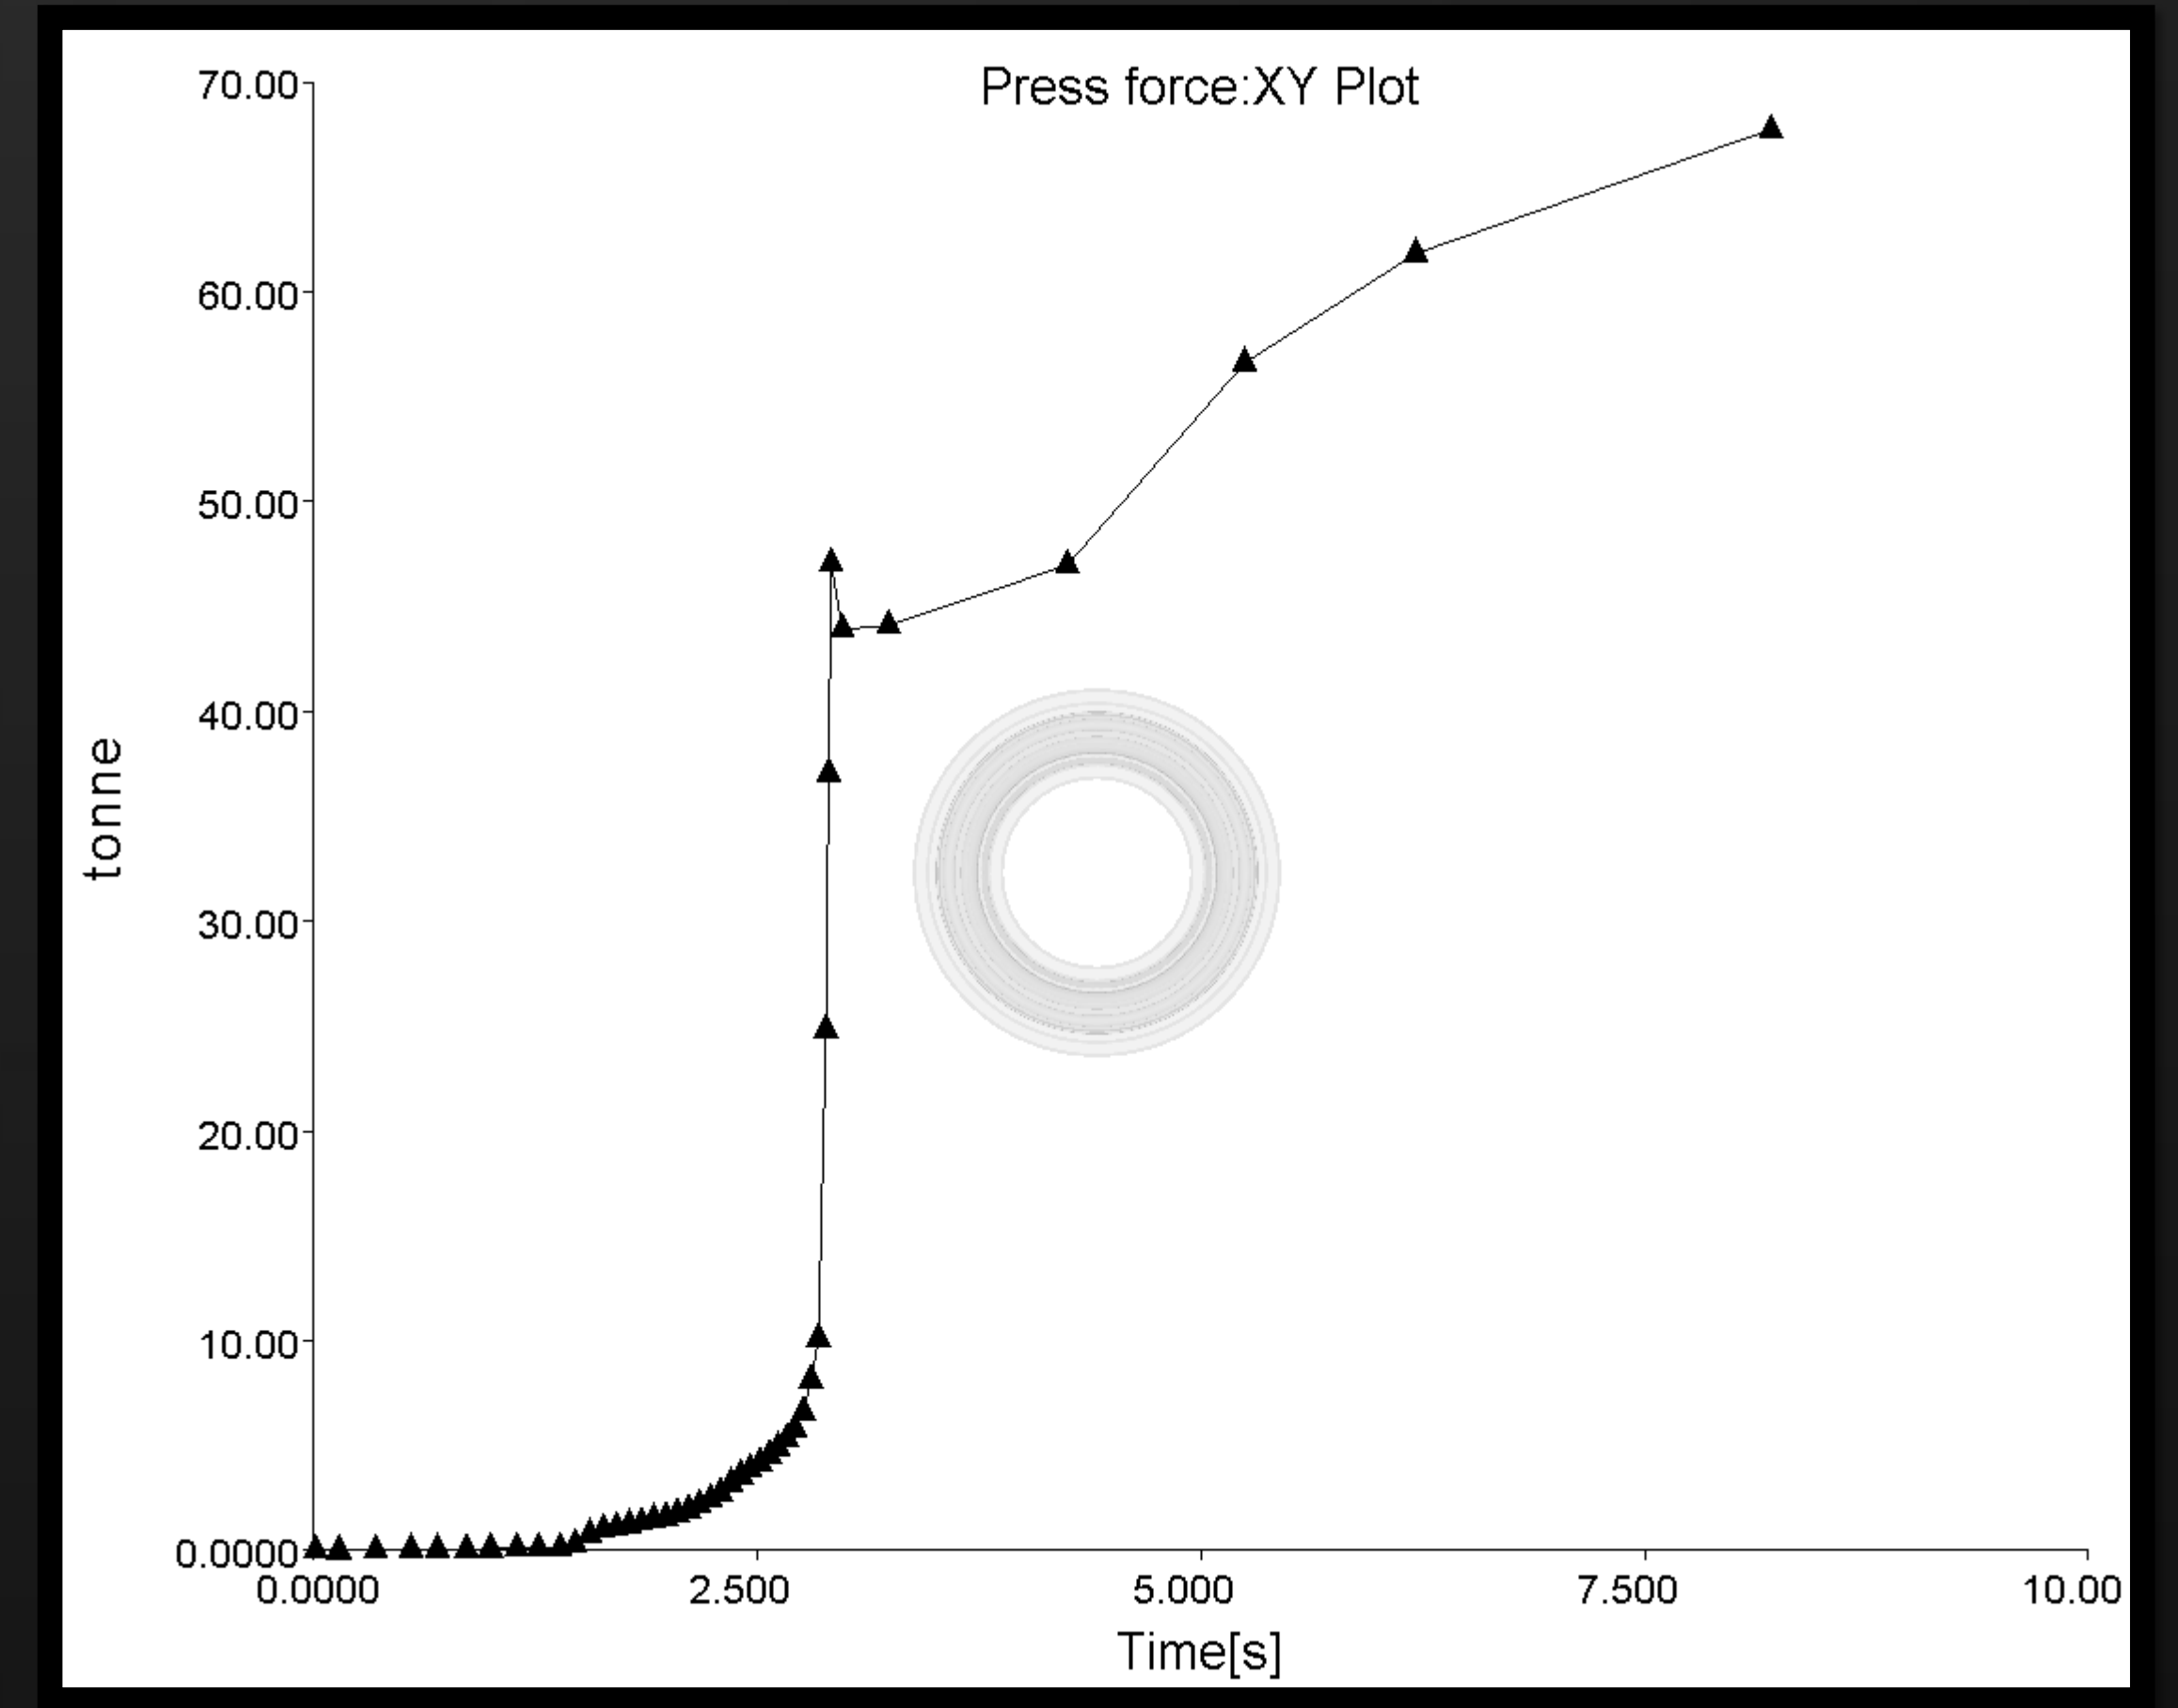

Mold Closing

- Movement of platen
- Linear Rate
- ~3 seconds to close

Clamp Force

- Force to close mold
- Force to keep closed
- Note ramp up after closure

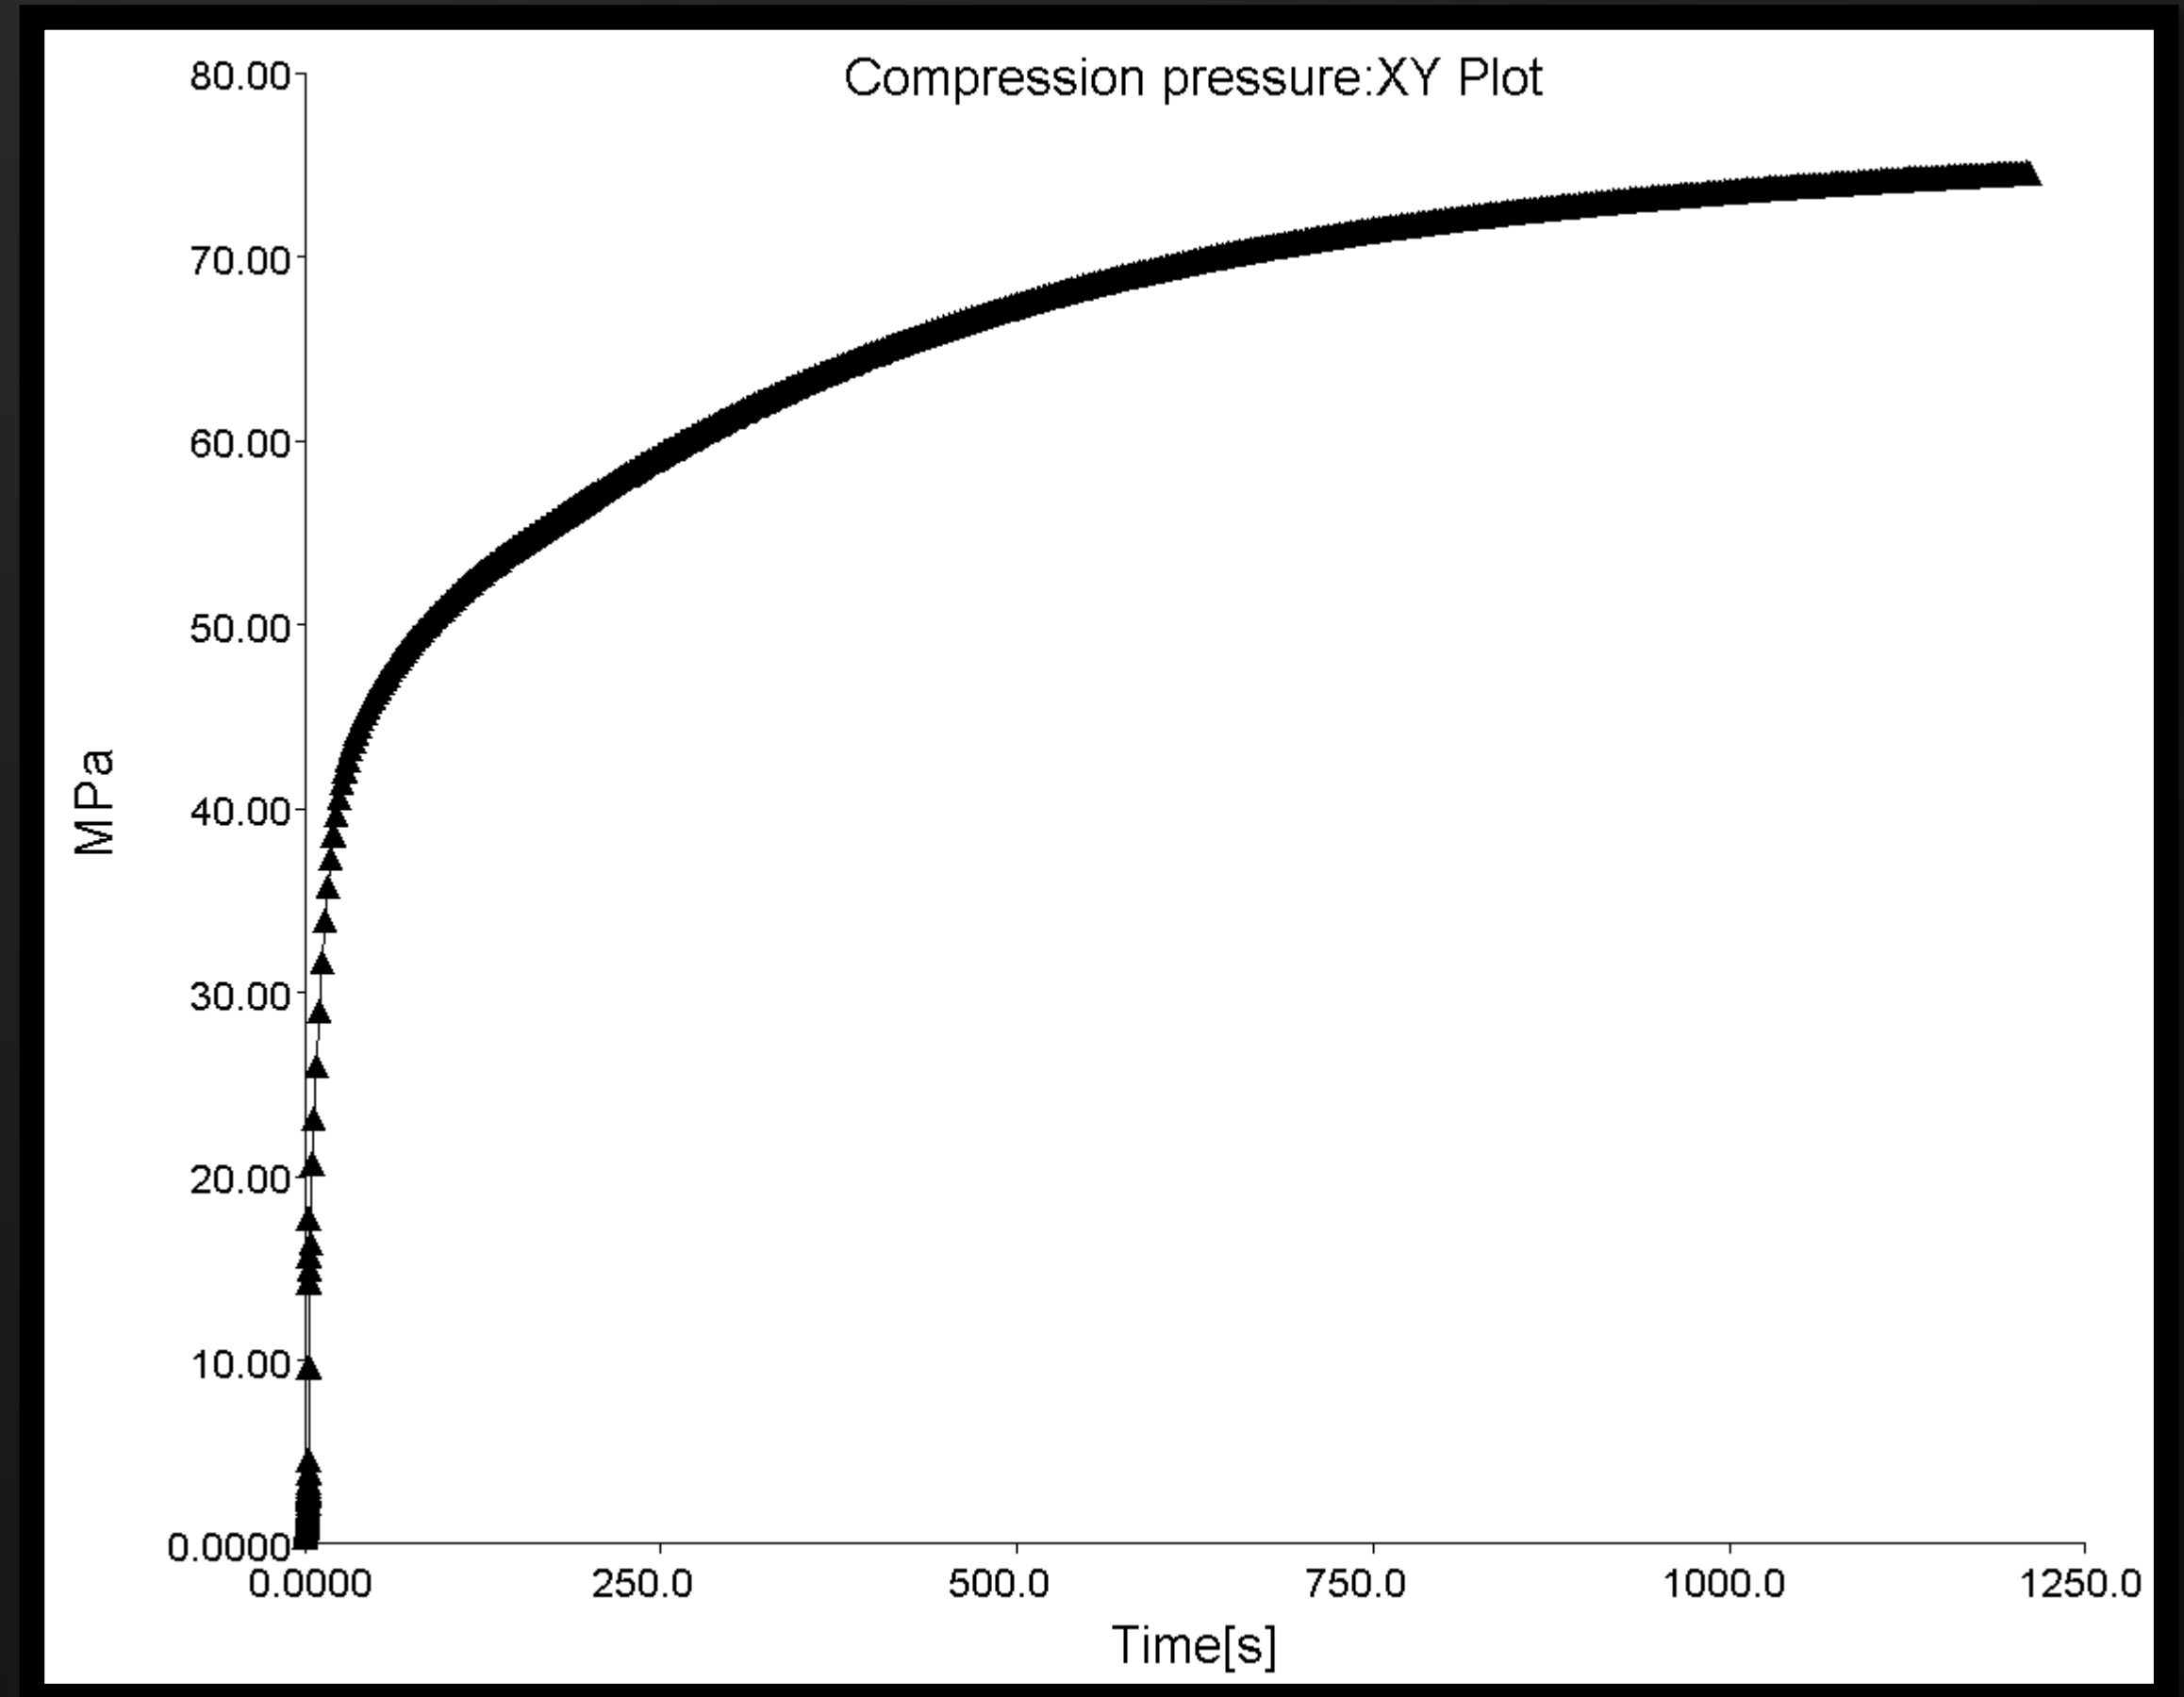

Clamp Force

- Force to close mold
- Force to keep closed
- Note ramp up after closure

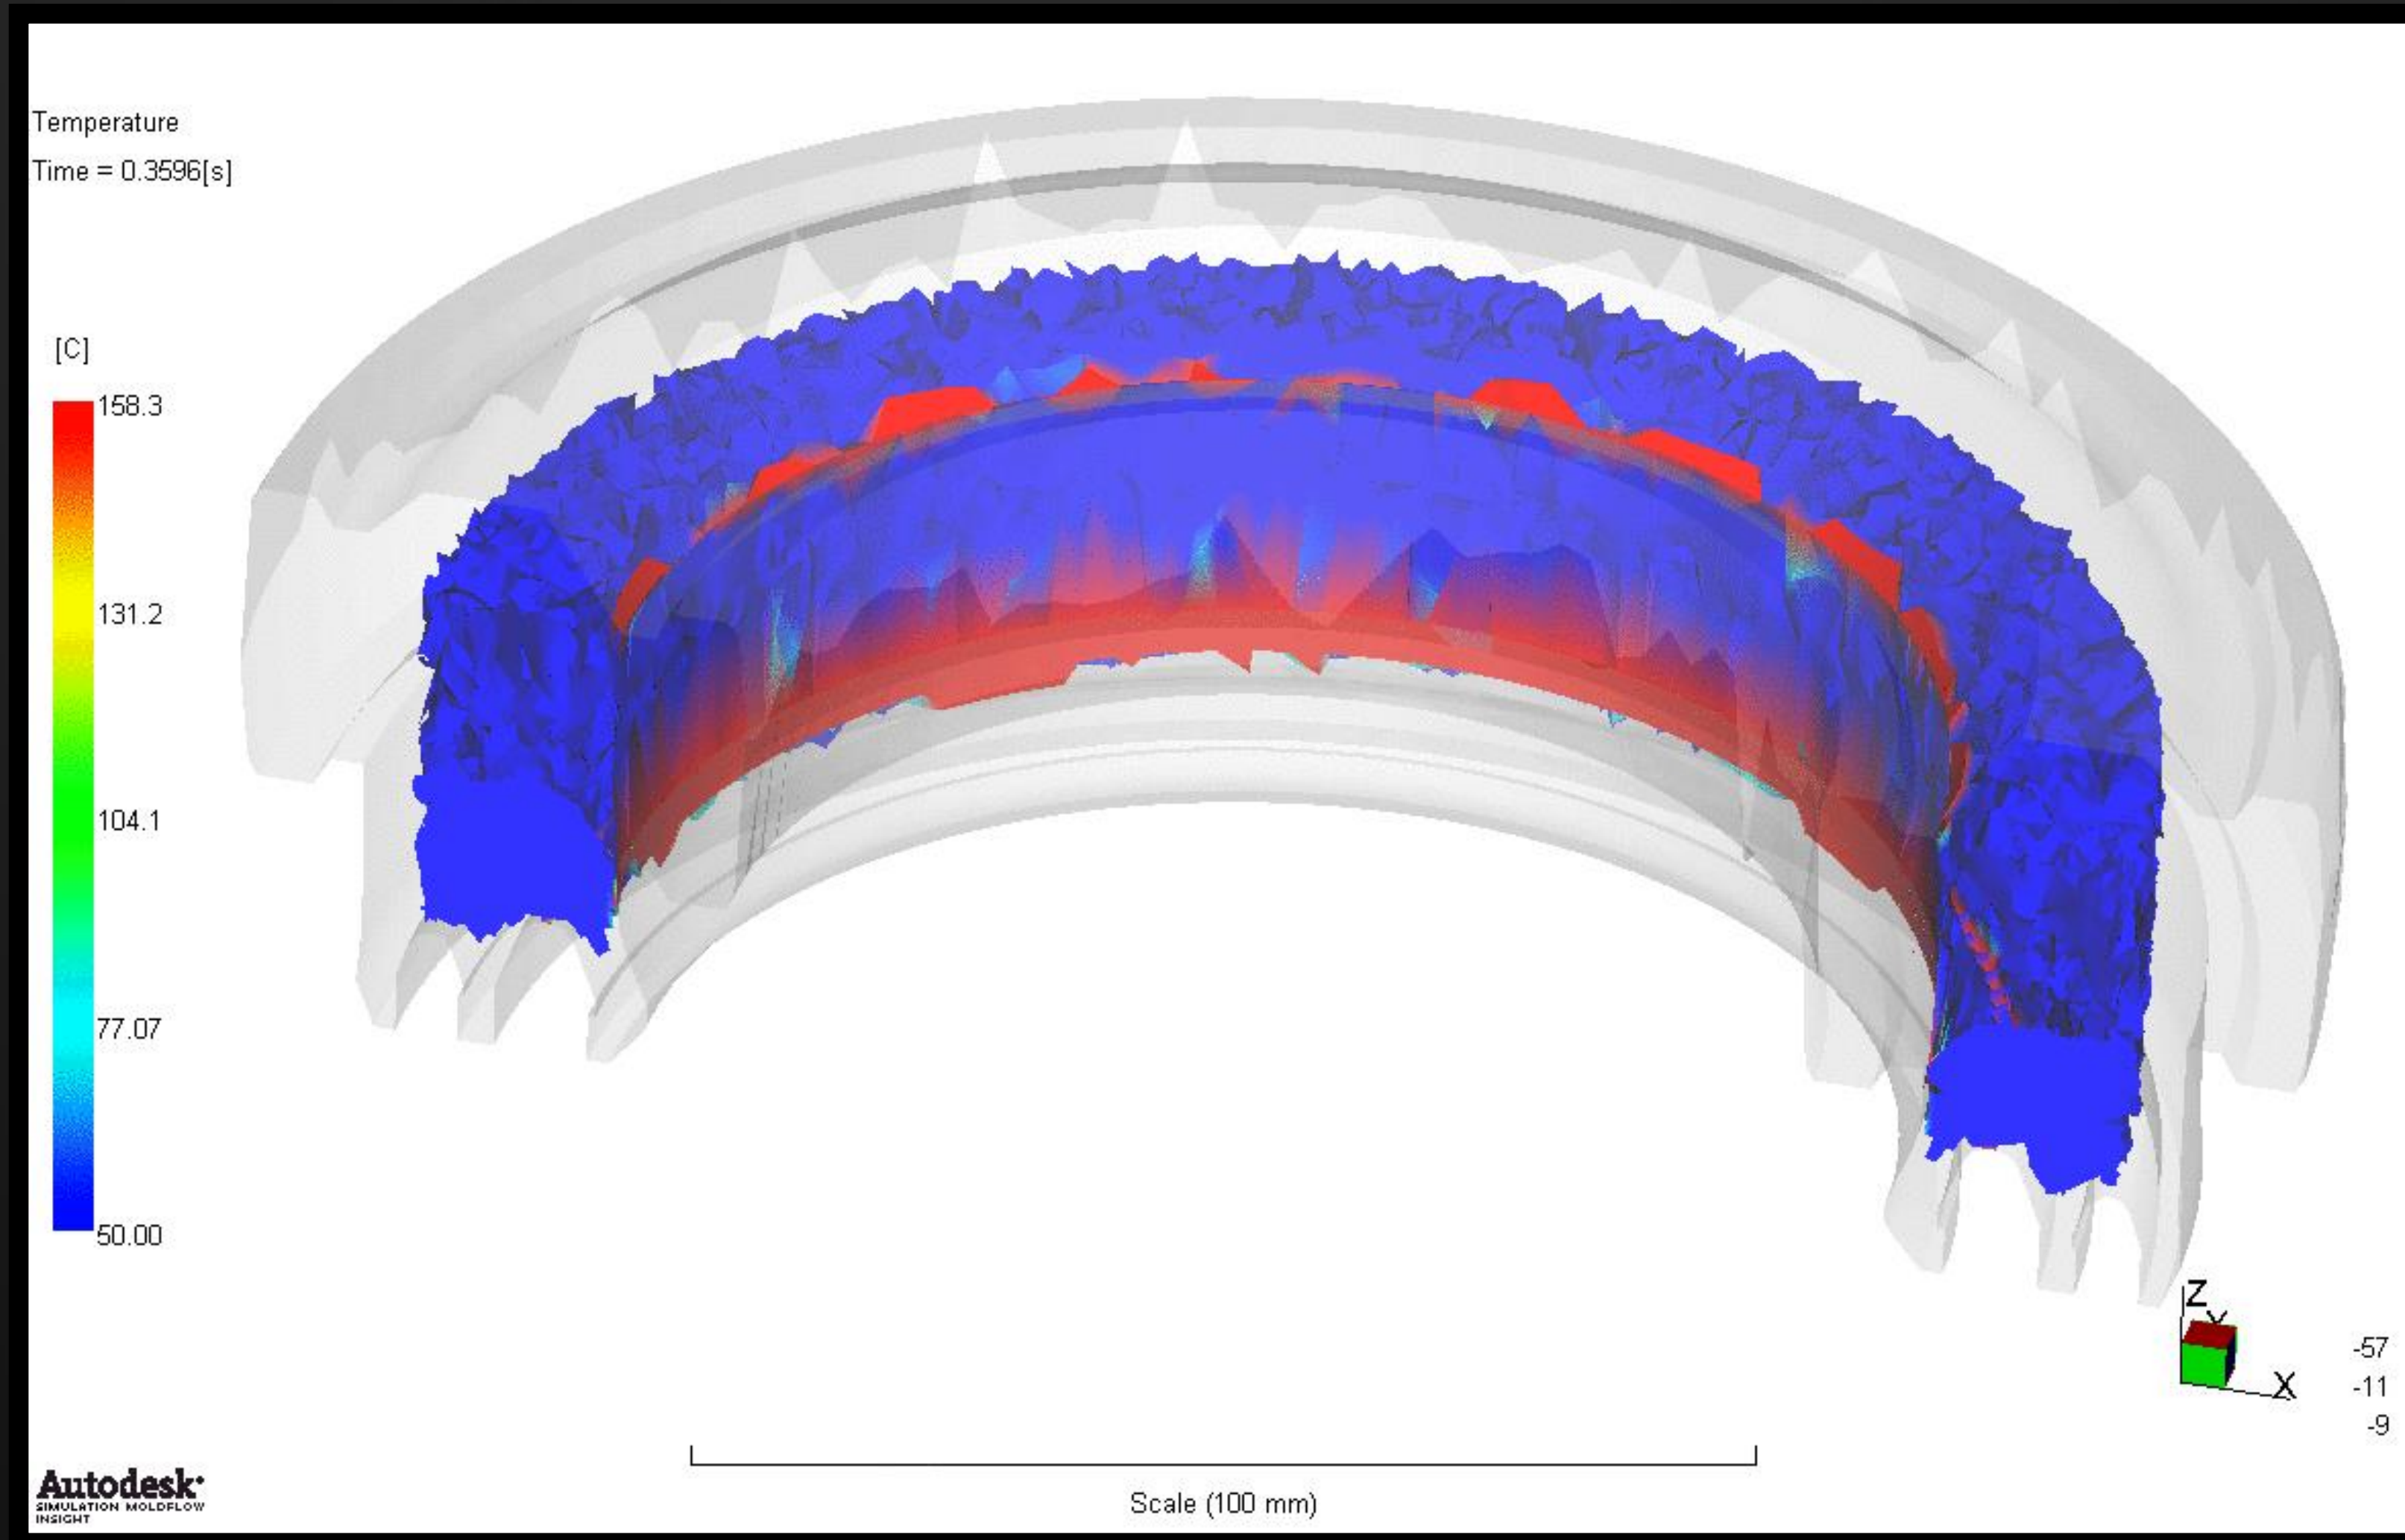

Cavity Pressure

- Pressure within the rubber
- Maximum Node
- Thermal Effect
- Effect of PVT – cure

Temperature Penetration

Temperature Penetration

- Thermal Conductivity
- Effects Crosslinking

Cure – Degree of Cross-link?

Cure – Degree of Cross-link?

- Not degree of crosslink
- Based upon viscosity
- Approaching infinite

Transfer Molding

Transfer Molding

- Transfer Pot
- Preform
- Overfill Grooves
- Cavity

Transfer Molding – Filling – Animation

Transfer Molding – Mold Closing

Transfer Molding – Clamp Force

Transfer Molding – Cavity Pressure

Transfer Molding – Temperature Penetration

Transfer Molding – Temperature Penetration

Transfer Molding – Cure – Degree of Cross-link?

Transfer Molding – Cure – Degree of Cross-link?

What do you think?

Opportunities

- Preform Sizing
- Process Development
 - Cure time
 - Cavity pressure confirmation
- Defect detection
 - Short shot
 - Backgrind

Bonus Round

Questions
