

Detail Friendly Design Modeling for Downstream

Ken Murphy

Design Technology Director – Thornton Tomasetti, Inc.

Joshua Bradshaw

Design Technology Manager – Thornton Tomasetti, Inc.

David Merrifield

Vice President of Operations – SteelFab Texas, Inc.

Class summary

Design models are not typically used in the construction process. This is because the designers won't give up their model, and if they do they use a liability waiver releasing them from any inaccuracies.

In this course, you will learn how leading structural engineering firm Thornton Tomasetti bridges the gaps between the design and construction trades helping design and construction timelines overlap by delivering an accurate, detailing and fabrication ready, model.

At the end of the presentation, you will hear a discussion from the contractors point of view: what steel detailing firms expect from structural engineers to effectively collaborate and exchange model-based information.

Key learning objectives

At the end of this class, you will be able to:

- Understand modeling discipline and best practices
- Effectively and efficiently communicate between the design and construction teams
- Understand what is needed for an effective strategy to produce fabrication friendly models
- Understand how cloud model hosting services help expedite your deliverables and enhance collaboration

The Great Transition...

Hand Drafting

Computer Aided Drafting

How much of an Improvement?

The Great Transition...

One Liberty Place
(1987)
60 Drawings

Hand Drafting

New York Times
(2007)
140 Drawings

Computer Aided Drafting

True Progress?

The Great Transition...

Better or Worse?

- Dimensional Information
- Clarity of Design Intent
- 1/2 Size Drawings
- Coordination Efforts
- Claims, Extras & RFIs

The Great Transition...

Computer Aided Drafting

Building Information Modeling

Improvement!

The Great Transition...

If a Shared Model isn't the Deliverable...

All of this...

Might as well be...

This

Share & Deliver: We can do it!

- **Boeing 777**

First 100% computer

Designed aircraft

(CATIA, 1993)

- Eliminated 3000+ assembly interfaces (No physical prototyping)
- 90% reduction in engineering change requests (6000 to 600)
- 50% reduction in cycle time for engineering change requests
- 90% reduction in material rework
- 50x improvement in assembly tolerances for fuselage

Share & Deliver: We can do it!

When a model isn't shared and delivered....

This...

can end up coming out looking like...

this...

Share & Deliver: We can do it!

“Insanity is doing the same thing over and over again and expecting different results.”

-Albert Einstein

- Designers have always been “smart”
- Designers have always “shared”
- Designers have always designed in 3D

but then...

- We don't share
- We deliver in 2D
- We deliver it “dumb”

Share & Deliver: We can do it!

Lost in translation

We're smart, our deliverable...
not so much.

- How big can that gusset plate be?
- How many tons? Cubic yards?
- How does that duct get past that beam?
- Where is *that* beam?
- How can I splice those bars?
- Are you 100% done?

Share & Deliver: We can do it!

Stop the insanity!

Mill Order Member Model

Full Connections & Embedded Information

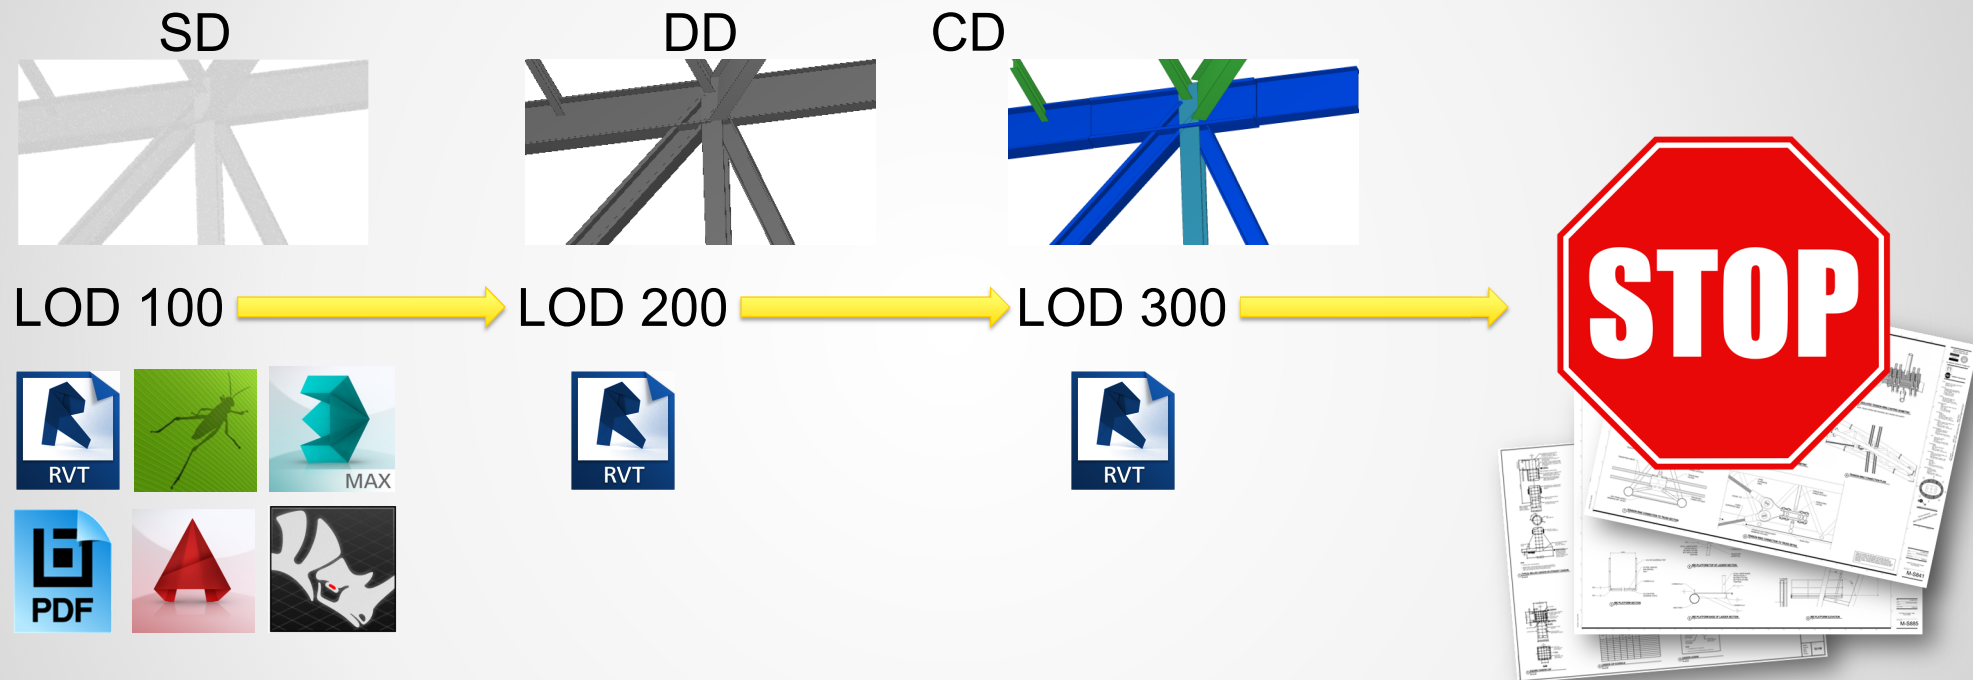

Shop Drawings

Share & Deliver: We can do it!

Design Intent Workflow:

Share & Deliver: We can do it!

Advanced Delivery Approach:

Advantages

Schedule Savings & Certainty

New Meadowlands Stadium, East Rutherford, New Jersey

- Design-Build, Design/Assist
- Ahead of schedule (3-6 Months)
- Model accuracy (What you see is what you get/want)
- Means and methods

Everybody wins!

Schedule Savings & Certainty

Cost Certainty

Data Center, Undisclosed Location

Increased Trade Coordination

New Meadowlands Stadium, East Rutherford, New Jersey

Increased Trade Coordination

Port Canaveral Welcome Center, Cape Canaveral, Florida

Reduction in RFIs

Port Canaveral Welcome Center, Cape Canaveral, Florida

Reduction in RFIs

Quantico Hangar, Quantico Marine Corps Base

- 760 Tons
- Only 1 RFI!!!

Change Order Validation or Reduction

- Quantities and complexity are identified as the design progresses.

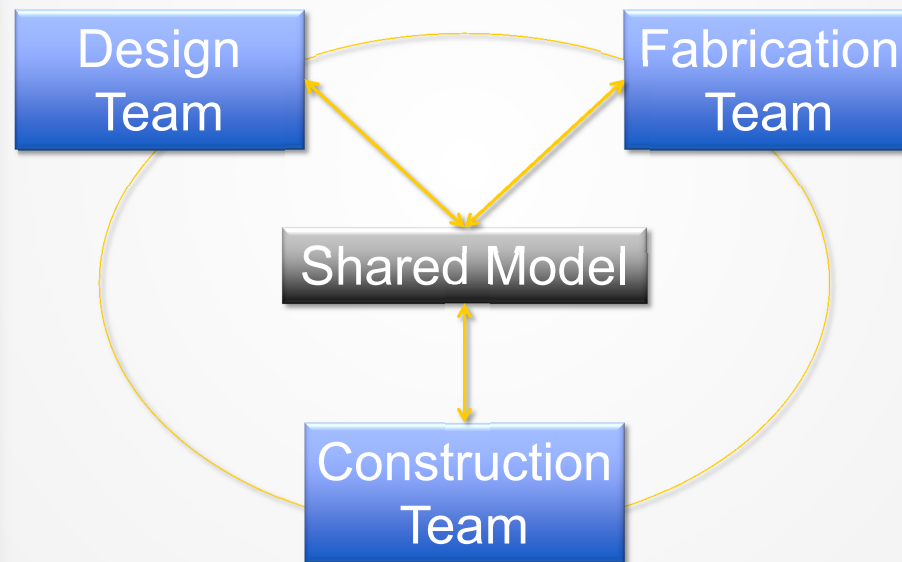

Change Order Validation or Reduction

- Once models are issued, they can be compared and quantities verified.

Change Order Validation or Reduction

- Sharing information allows potential change orders to be identified earlier in the process.

Change Order Validation or Reduction

- In projects where the proper approach is implemented, change orders have been estimated by CMs to be reduced by 25%.

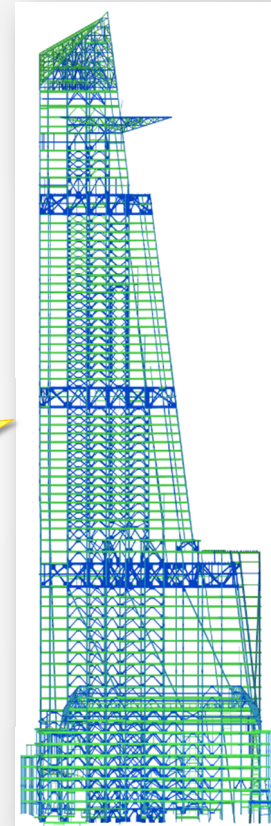

Change Order Validation or Reduction

This change
adds over
1,000 tons!

By my
calculations, it's
just more than
100 tons...

Strategies for Fabrication Friendly Models

- BIM Execution Plan/Scope - beyond standard design
- Project Trade Experts: staff or contracted

Scope - beyond standard design

- Connection Design
- Advance Bill of Materials (ABM)
- Full Connection Detailing
- Misc Steel, Shop Drawings & Erection Sheets

Scope - beyond standard design

Sheet Number (if applicable)	Detail Number (if applicable)	Description	Model Responsibility Matrix		
			TT	Fabricator	Comments
Phase I model scope					
		Geometrically accurate model	X		
		Accurate Member Sizes	X		
		Accurate Material designations	X		
		Contains CVN designations where required	X		
		Member provided workpoint to workpoint	X		
		Adding / Subtracting material	X	X	If connections have been started then material will be actual length. Else any material additions or subtractions for material cutting or skewed end conditions will be Fabricators responsibility to review
Phase II model scope					
Main Steel elements					
Sheet Number (if applicable)	Detail Number (if applicable)	Description	Model Responsibility Matrix		
			TT	Fabricator	Comments
		Main Structural Steel elements	X		Columns/Girders/Beams/Bracing/Frames/Built-up shapes/Girts/Trusses
		Web Penetrations	X	X	TT to model those shown on the structural drawings; All other openings (if any) by Fabricator
		Special Beam end copes	X	X	TT to model those shown on the structural drawings; All other copes non connection specific (if any) by Fabricator
		Minor / Misc Steel Members		X	Includes elevator divider beams, misc steel and any steel members not sized in the structural documents

Scope - beyond standard design

Main Steel connections				
Sheet Number (if applicable)	Detail Number (if applicable)	Description	Model Responsibility Matrix	
			TT	Fabricator
		Steel Connection Material for Main Structural Steel	X	
		Copes required connecting members	X	
		Weld Sizes	X	
		Shop Weld Preps		X
		Field Weld Preps		X
		Field bolts	X	
		Shop bolts		X
		Backing Bars		X
		Surface preparations		X
		Mill to bear surfaces		X
		Column base plates	X	
		Anchor Bolts	X	
		Anchor Bolt templates		X
		Fill plates	X	
		Tight flange to flange plate connections/Web vertical	X	
		Tight flange to flange plate connections/Web horizontal	X	

Tension controlled bolts. Diameters and grades as required per connection design. Fabricator will request substitution if needed due to availability or alternate tightening method.

All connection required bolts will be provided as field bolts

Any gaps greater than 1/16" will be filled with a single plate of the thickness equal to the gap

1/4" Deck plate provided at top & 1/4" Fill plate provided at bottom

1/4" Fill plate provided on each flange

CIRCUIT OF THE AMERICAS – FORMULA ONE RACETRACK AUSTIN, TEXAS

Design Model versus Fabrication Model

- **Main members – Do they meet the definition of LOD 300**

- *The Model Element is graphically represented within the Model as a specific system, object or assembly in terms of quantity, size, shape, location, and orientation. Non-graphic information may also be attached to the Model Element.*
- Bimforum interpretation: The quantity, size, shape, location, and orientation of the element as designed can be measured directly from the model without referring to non-modeled information such as notes or dimension call-outs. (From LOD Specification)

Level 300 Elements easily transferred to Fabrication Level software.

Secondary Steel Members Treated as Generic Sections or LOD 300 Elements

Items such as suspended supports, kickers, deck edge, brick and stone support, etc. require coordination with other trades and need to be properly located. The most expensive material per pound is not modeled as but usually treated “Typical” in design models!

Trade Coordination or LOD 350 (1st Fabrication level)

- *The Model Element is graphically represented within the Model as a specific system, object, or assembly in terms of quantity, size, shape, location, orientation, and interfaces with other building systems. Non-graphic information may also be attached to the Model Element.*
- BIMForum interpretation. Parts necessary for coordination of the element with nearby or attached elements are modeled. These parts will include such items as supports and connections.
- (From LOD Specification)

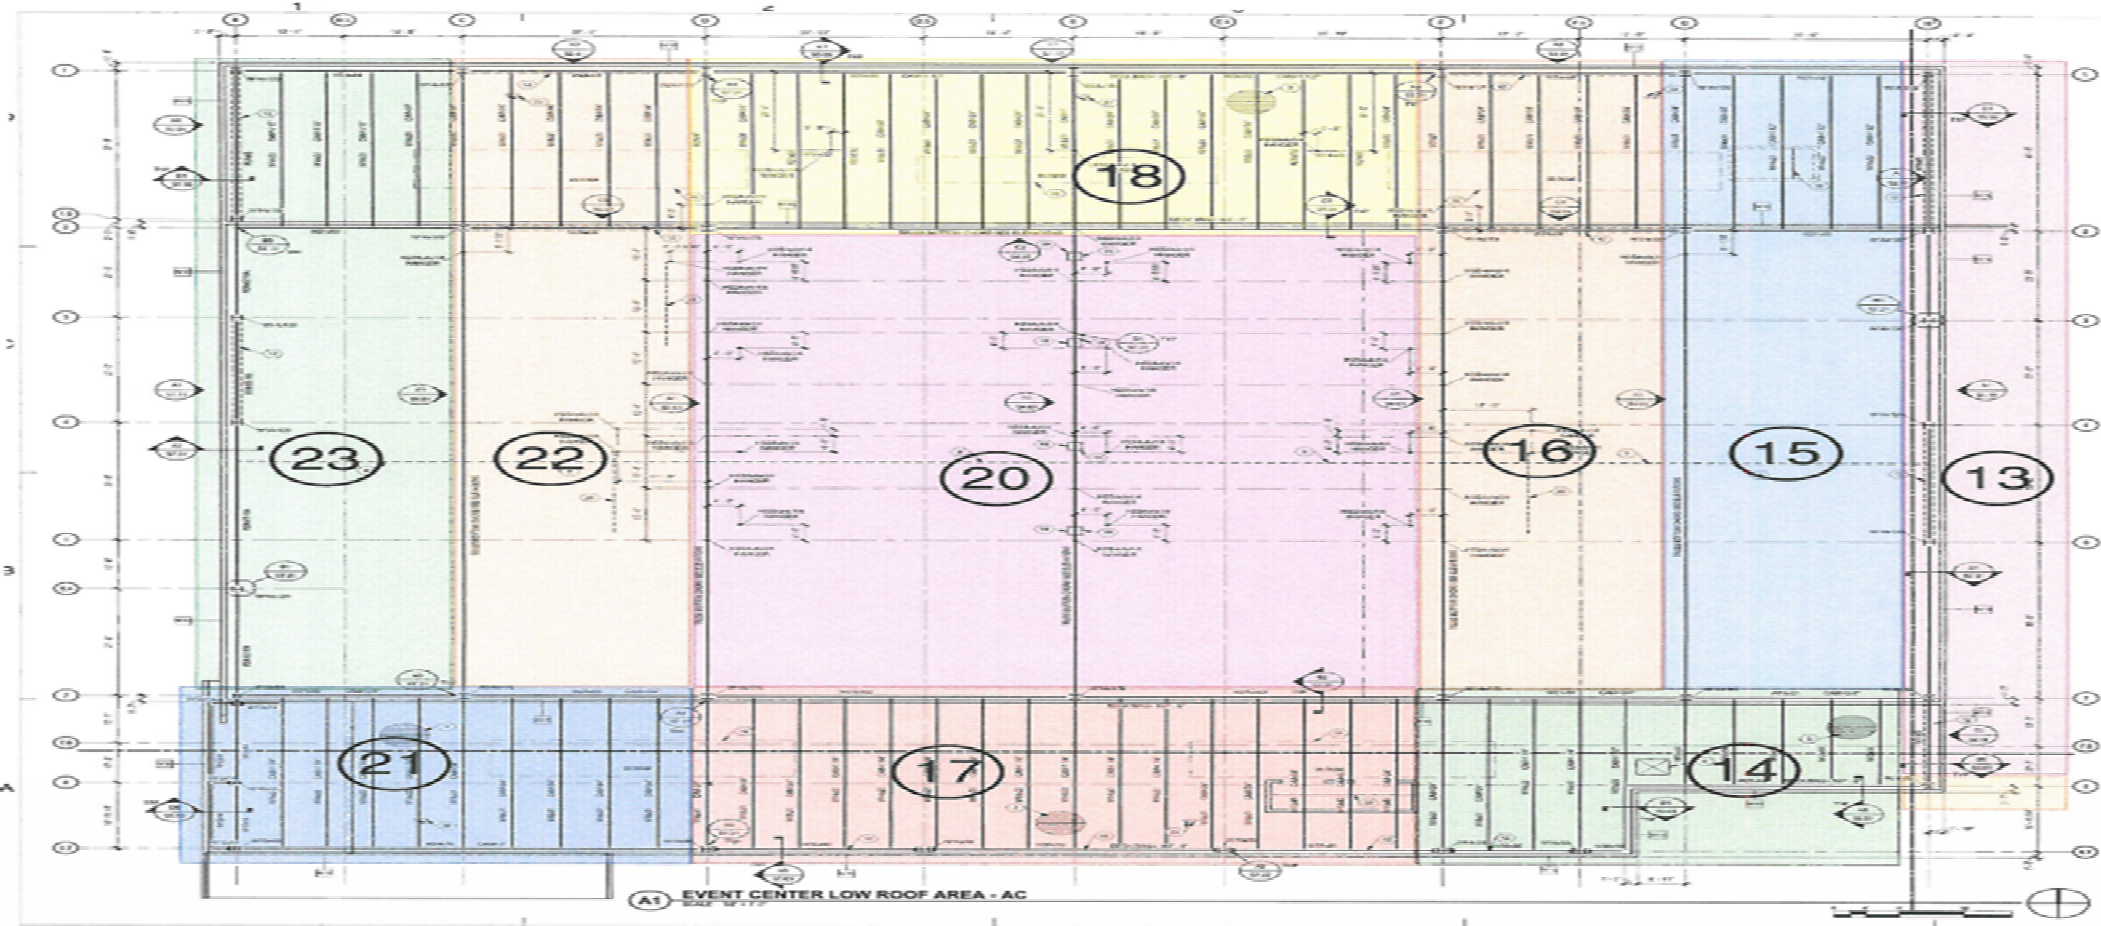

LEVEL 350 MODEL – TRADE COORDINATION

ADVANCE BILL OF MATERIAL

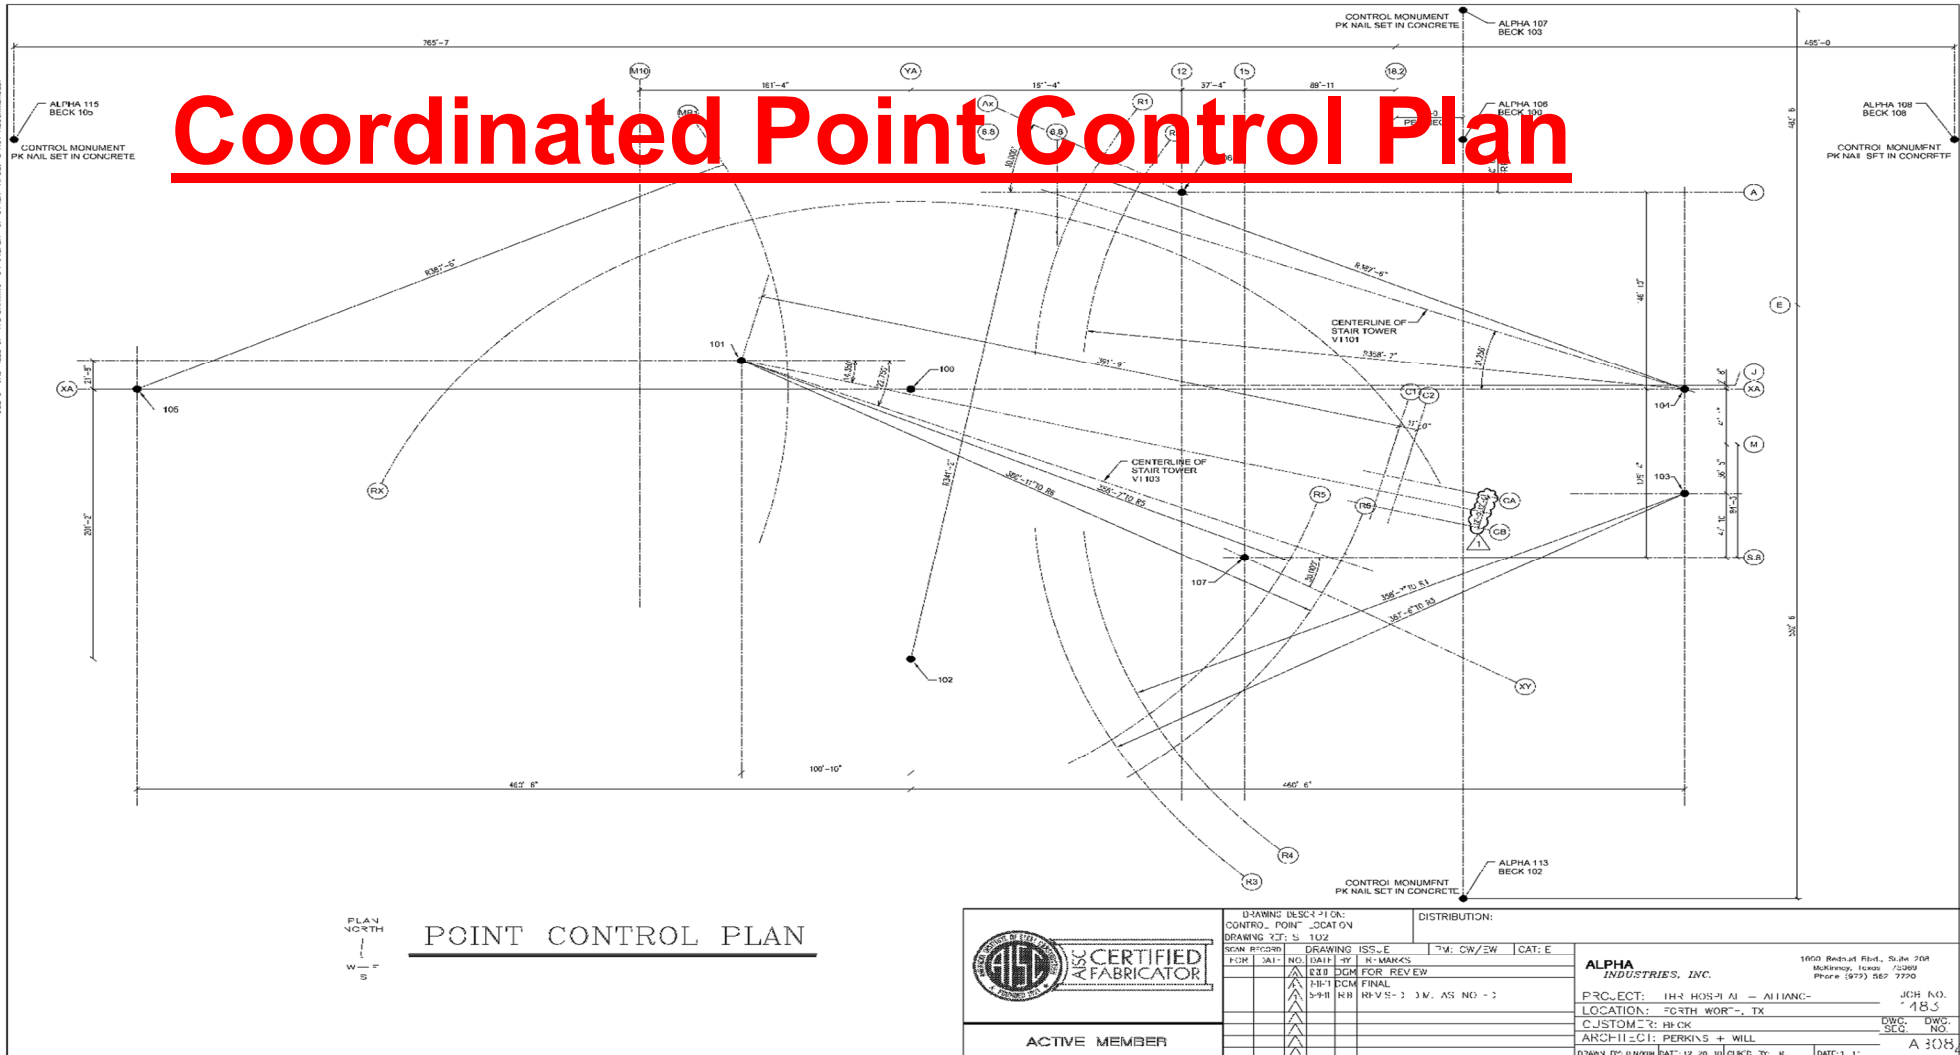

- The reason Fabricators hit the ground running after being notified of successful bid.
- Material is approximately 60% of fabrication cost.
- Some members have long lead times or a rolling was missed.
- Key to fabrication planning and routing.

Fabrication and Erection Sequences-Why not the complete building?

THIS DRAWING AND PROJECTIONS FOR THE PURPOSES OF SITE PLACEMENT AND ARE NOT TO BE USED FOR CONSTRUCTION. USE OF THIS DRAWING FOR CONSTRUCTION OF OTHER TRACES IS NOT RECOMMENDED.

SHOP DRAWING QUALITY

How is quality defined?

Quote from ANSI/AISC 360-10. Chapter “N” “Quality Control and Quality Assurance”

N.5.1 “For QC inspection, the applicable construction documents are the **shop drawings** and the **erection drawings** and the applicable referenced specifications, codes and standards.”

5 Points Within the Detailing operations

Quality in production

Both the model and the “paper” reflect job and fabricator requirements

Quality in check

Both the model and the “paper” conform to design and fabrication standards

Quality Control

Are procedures in place to ensure the outcome are predicable

Quality Management

Do the system and procedures of the organization reflect management’s commitment to maintain and improve quality

Quality Assurance

Do your clients have confidence that your quality meets their quality goals

Who is responsible for the quality of the shop and erection drawings?

Ultimately the responsibility for quality falls to whoever holds the “contract”. The fabricator is generally that responsible party. The selection of a detailer by a fabricator should be based on “his” quality control manual.

Why Fabricators need a standard presentation

Communication from the model to other programs
Within the organization require a standard language to communicate. Fabricators define piece marking system based on how purchasing/production control and the shop floor have defined elements . (Bar versus Flats or Plate)

The same organization on drawings prevents errors on the shop floor. (members marks or weld symbols always in the same relative position)

The role of Detailers/Modelers in today's work flow

- Shop Drawings are the Contractor's Achilles heel.
- Detailer/modelers are the translators of design ideas into fabrication elements (thoughts into reality)
- Most Fabricators sub-contract the Modeling/shop drawings process.
- Most sub-contract firms are not local to the project.

HOW DO YOU DEFINE DETAILERS/MODELERS

- Design
 - Fabricate
 - Build
 - Operate
