

UT20934 – 3D Modeling Practices and Standards for Substations

Michael Chasser – Burns & McDonnell Substation Designer Section Manager

Jason Rugg – Burns & McDonnell Electrical Detailer

www.burnsmcd.com

Safety

Safety Topic – Hard Hat Safety

- ALWAYS wear a hard hat when in a work-zone
- Inspect hard hat daily for dings or defects, replace if found
- Ensure proper hard hat “class” is worn:
 - Class G – General Helmet
 - Impact resistance, electrical resistance up to 2,200V
 - Class E – Electrical Helmet
 - Electrical resistance up to 20,000V
 - Class C – Conductive Helmet
 - Per OSHA, these provide no protection against electrical hazards
 - Lightweight & more comfortable

HEAD PROTECTION CHART

Source	Assessment	Protection
Impact	Falling objects	Hard Hat. Specify type. (See ANSI performance requirements)
	Collision with fixed object	Hard Hat. (See ANSI performance requirements)
Electrical	Contact with exposed electrical wires, conductors	Class A or Class B Hard Hat, depending upon exposure. (See ANSI performance requirements)

**American National Standards Institute
(ANSI) Performance Requirements**

	Class G	Class E	Class C
Description	General service, limited voltage protection	Utility service, high voltage protection	General service, metallic, no voltage protection
Material	Water resistant, slow burning	Water resistant, slow burning	Water resistant, slow burning
Insulation Resistance	2200V, 60Hz for 1 min. with 3 mA max. leakage	20,000V, 60Hz for 3 min. with 9 MA max. leakage	N/A
Flammability (Burn Rate)	3 in/min max	3 in/min. max	N/A
Impact Resistance (Transmitted Force)	850 lb average 1000 lb maximum	850 lb average 1000 lb maximum	850 lb average 1000 lb maximum
Penetration Resistance	3/8 in maximum	3/8 in maximum	7/16 in maximum
Standard	Z89.1-1969	Z89.2-1971	Z89.1-1969

Introductions

Michael Chasser

Burns & McDonnell Substation Design Section Manager

12 Years Substation Design Experience (12kV-765kV)

Inventor & Vault Experience – 2+ Years

Introductions

Jason Rugg

Burns & McDonnell Electrical Detailer

Autodesk Inventor Certified Professional

Inventor & Vault Experience – 12+ Years

Class summary

This class will cover:

- Industry best practices for 3D substation design utilizing Inventor & SBS Substation Design Suite.
- Vault integration to maximize efficiency.
- Processes that ensure consistency, flexibility, & usability of 3D models.

Key learning objectives

At the end of this class, you will be able to:

- Learn how to produce 3D models that are accurate, consistent, & user-friendly.
- Discover best practices for part and assembly creation.
- Learn how to use Vault to capitalize on 3D model data.
- Learn how to use Inventor to transform the substation design processes.

**Learn how to produce 3D
models that are accurate,
consistent, & user-friendly**

Begin at the End...

- What will the 3D models be used for?
- What data do we want from the 3D models?
- Who will be using the 3D models?

Make Decisions

- Visual Fidelity vs. Visual Identity
- What Models Should be Developed?
- Model Development Process

Make Decisions (cont'd)

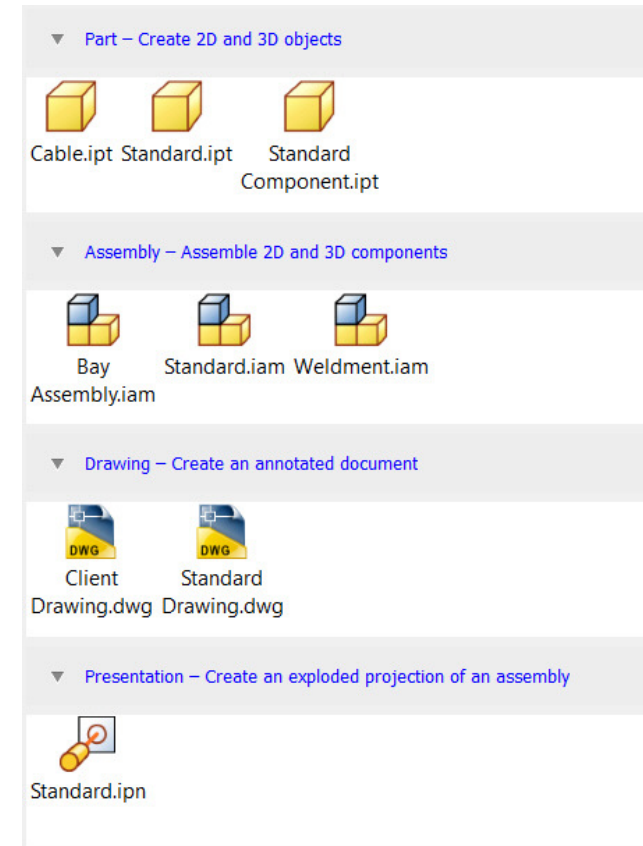

- Determine Modeling Guidelines
- How will models/data be organized/tracked/controlled?
- File Naming Structure(s)

Discover best practices for part and assembly creation

Develop Templates

- Create Inventor project file (.ipj)
- Develop templates that are complete & well thought-out
 - .ipt (Part File)
 - .iam (Assembly File)
 - .idw &/or .dwg (Drawing File)
 - .ipn (Presentation File)
 - Changes to templates later create inconsistency
 - Possibly need multiple of each template type (depending on need) MAKE DECISIONS...

Best Practices

- Develop standard “library” of parts & assemblies (new & legacy)
- Z-Axis should always be up
- Sketches should be fully constrained (when applicable)
 - When is it NOT applicable?

Don't reinvent the wheel

Best Practices (cont'd)

- Fill out iProperties while developing parts
- Use base origin point/planes/axis for constraints

Best Practices (cont'd)

- Utilize End of Part Marker (EOP) to control feature visibility
 - Models are less resource intensive
 - Control visual fidelity
 - Decrease file size

Best Practices (cont'd)

- Minimize use of patterns and mirrors (grounded vs. not grounded)

Using Patterns & Mirrors	Using Multiple Instances with Constraints	Using Multiple Instances & Grounding
15-30%	10-20%	5-15%

CPU Usage

Best Practices (cont'd)

- Verify degrees of freedom
 - Assemblies only
- Use “analyze interference” tool

Best Practices (cont'd)

- Modular design approach
 - Develop parts, place into commonly used component assemblies
 - Place component assemblies into sub-assemblies
 - Place sub-assemblies into master assembly

Best Practices (cont'd)

- Component Assembly Example

Best Practices (cont'd)

- Component Assembly Example

Best Practices (cont'd)

- Sub-Assembly Example

Best Practices (cont'd)

- Master Assembly Example

Best Practices (cont'd)

- Utilize Level of Detail (LOD)
- Keep browser tree organized
- Use “enforce unique file names” feature within Vault

Learn how to use Vault to capitalize on 3D model data

Vault Setup

- User-groups/permissions
 - Folder structure

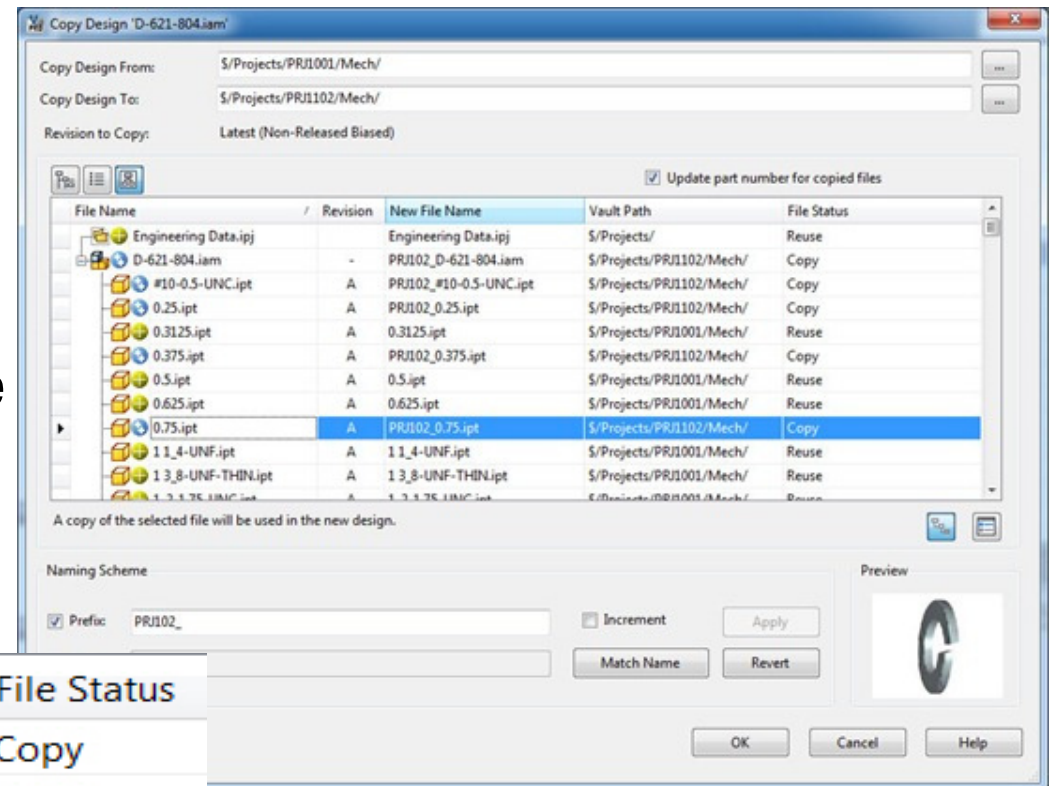

Vault Setup

- Lifecycles
 - Use to enforce adherence to policies & procedures
 - Utilize Vault states to progress through processes
- Categories
 - Use to organize files & enforce adherence to policies & procedures (differing entities within one company)

Copy Design

- Re-used vs. Copied
- Prefix/Suffix Naming Scheme (if applicable)

File Name	File Status
ANCHOR BOLT 1 - 1 IN DIA X 1 ...	Copy
BLT_TR_1 x 16 x 5 1-2 x 2.ipt	Reuse
NUT_HX_1.ipt	Copy
WASHER_FLAT_1 x 1 3-4.ipt	Reuse

Managing Information

- Mass iProperty Editing
- Advanced Search Capabilities
- File tracking & linking

History	Uses	Where Used	Change Order	Preview	
Number of versions:		10	(Local = Unknown)

Learn how to use Inventor to transform the substation design processes

Autodesk Inventor/SBS Substation Design Suite

- Powerful Configuration Capabilities
- SBS Substation Design comes standard with several tools that allow you to configure hardware selections like fittings and clamps to your own standards.
- Build out several standard configurations for various regions or engineering firms can create separate configurations for each customer.
- With the built in ability to add your own hardware and configure things like clearance values, iProperties and fitting classes.

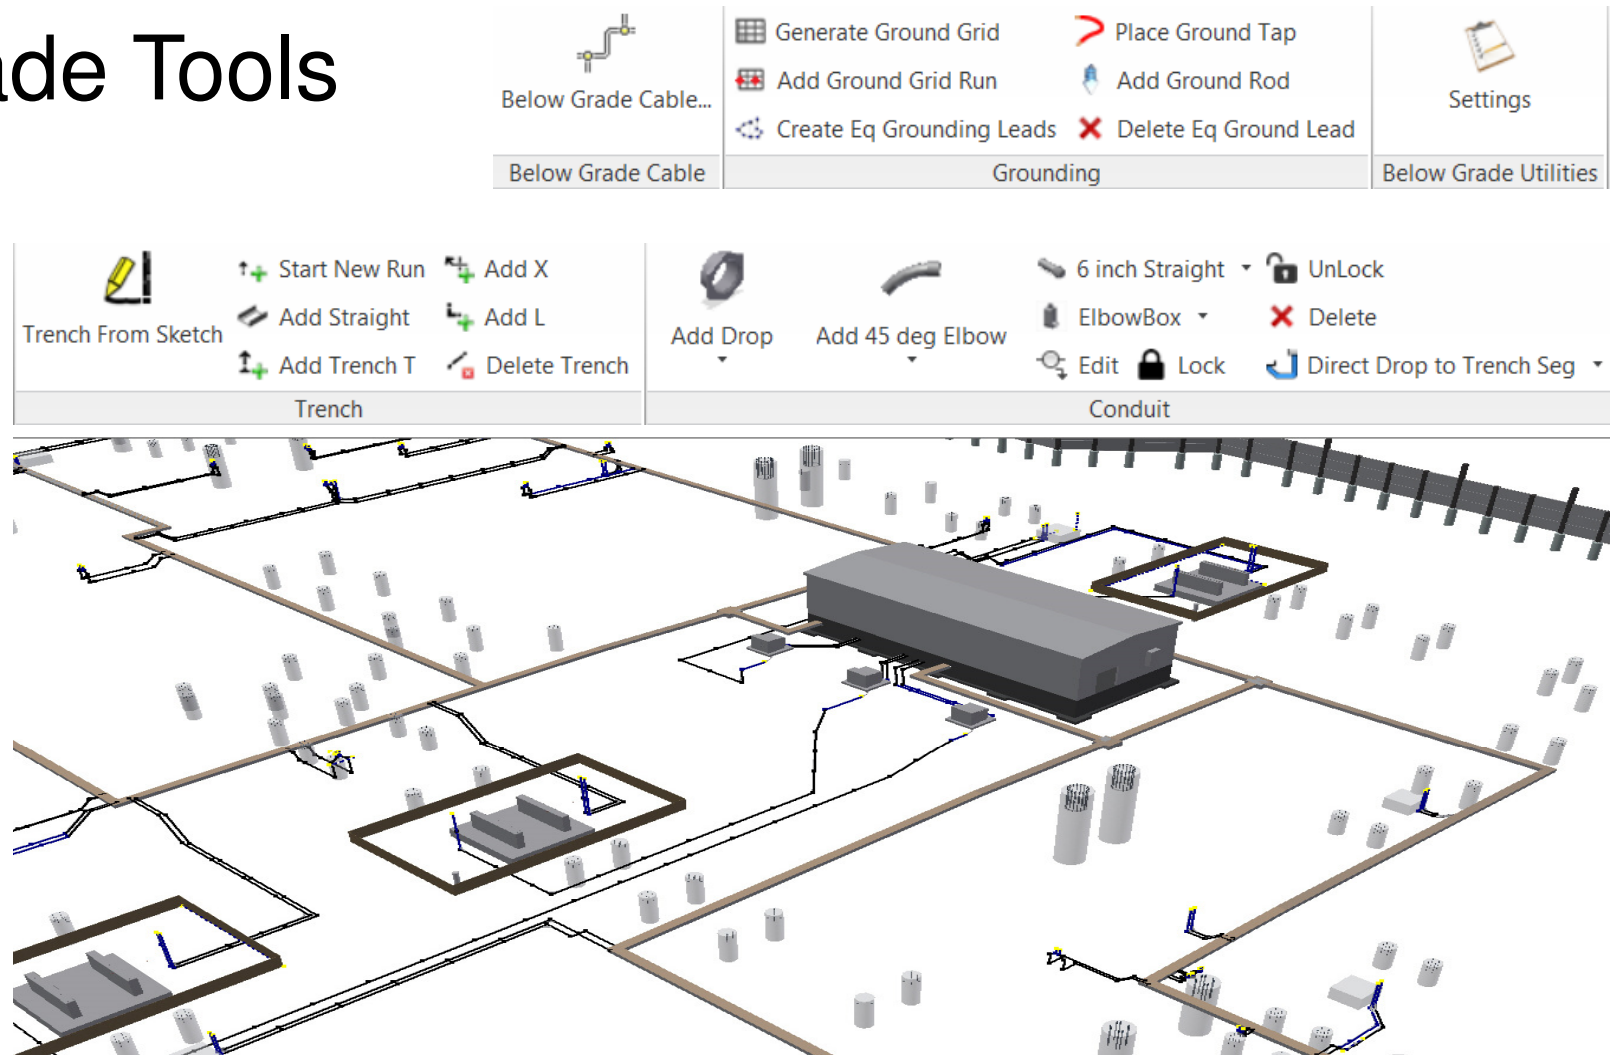

Above Grade Tools

- Insert Terminal, Cable & Bus Fittings
- Rigid Bus Routing
- Cable Routing
- Lightning Protection

Below Grade Tools

- Grounding
- Trench
- Conduit

Design Check Tools

- Phase to Ground Clearance
- Phase to Phase Clearance
- Fence Safety Clearance
- Live Part to Roadway Clearance

The screenshot shows the 'Design Checks' dialog box with three tabs: 'Inputs', 'Design Checks', and 'Results'. The 'Design Checks' tab is active. It contains several sections of controls:

- Geometry Checks:** A list of five checks, each with a 'Run' button:
 - Phase to Ground Clearance
 - Phase to Phase Clearance
 - Fence Safety Clearance
 - Live Part to Roadway Clearance
 - Lightning Protection
- Toggle Clearance Check Parameter:** A single button below the Geometry Checks section.
- Compatible Capacity/Rating Checks:** A 'Run Checks' button followed by four unchecked checkboxes:
 - Rated Maximum Voltage
 - Rated Maximum Ampacity
 - BIL
 - Equipment Ratings
- Model Checks:** A 'Run Checks' button followed by one unchecked checkbox:
 - Equipment Grounding
- Seismic Checks, Simulate Cable Motion:** A 'Run Sim' button followed by a label '+/- Seismic Displacement Values:' and three input fields, each containing '0.0'. Below these fields are the labels 'Delta X', 'Delta Y', and 'Delta Z' respectively.
- Apply to Fitting...:** A button located below the seismic input fields.

At the bottom right of the dialog box are 'Done' and 'Cancel' buttons.

AutoCAD Electrical Integration

- Inventor/AutoCAD Electrical Versions 2016 or Greater
- Establishes Electromechanical Link (.emx) between Inventor and AutoCAD Electrical to facilitate interdisciplinary checking
- Schematic diagrams can be checked within Inventor and vice versa
