

Every Expert was once a Novice: Getting Started with PLM 360

Rodney Coffey
PLM Consultant

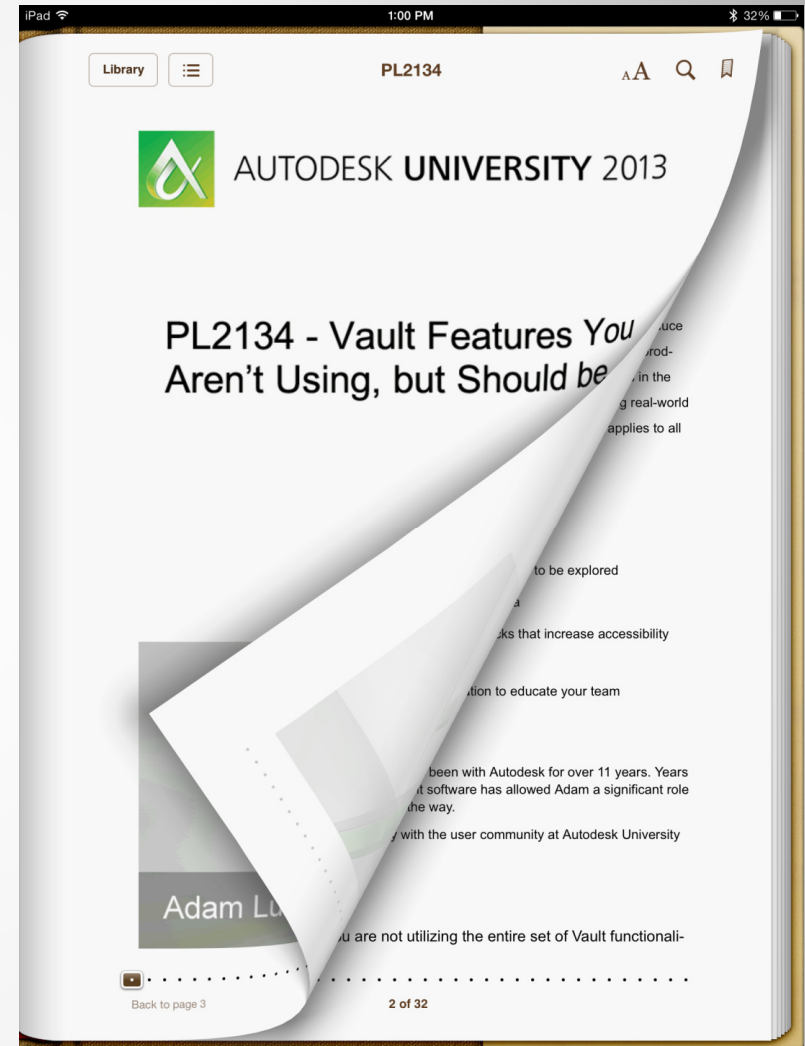

Your Instructor

Rodney is a PLM Consultant for Razorleaf Corporation. He has spent the last 10 years of his career in the Autodesk Manufacturing Channel responsible for Training, Implementation, Migration, and Solution Building. He has extensive experience around the Autodesk manufacturing products including Autodesk AutoCAD, Inventor, Vault, and PLM 360. In his current role his primary focus is the PLM 360 product. He and his team have partnered with Autodesk Consulting to provide customers with a better understanding of how PLM 360 can solve their business problems. These services include 360 scripting, training, implementation, and development.

Course Handout

- The handout for this course is available in epub or mobi format
- Find it on the AU website for this course
- Use Drop Box/Skydrive or email to your mobile device

Class summary

Autodesk® PLM 360 offers a powerful set of tools that can be used to configure solutions to a customer's business needs. In this class, we discuss best practices for getting started in Autodesk® PLM 360 . We cover how to properly manage your project using the tool itself. This includes technical methods and examples for environment change management and roll out. The goal of this class is to enable administrators to be efficient, from planning to deployment.

Key learning objectives

At the end of this class, you will be able to:

- Describe Best Practices for Getting Started in PLM 360
- Be prepared for scripting on top of your solutions
- Recognize the importance of managing best Practices and Environment Change
- Recognize that with great flexibility in configuration, comes great responsibility

Who are You?

A few questions to learn our audience:

- How many have used Autodesk® PLM 360?
- How many have built a workspace or application in Autodesk® PLM 360?
- How many have attended other Autodesk® PLM 360 classes here at AU?
- How many have any other Autodesk University Courses Left?

Why Best Practices

Why Best Practices?

Regardless of the software being implemented or the size of the project, a few key points are common:

- Administrators are looking for tools that give them freedom to design and configure solutions to solve their business problems
- Once they have found the right tool, they will quickly begin to limit methods and practices that others should use when using that tool

Why Best Practices?

Companies that do this the best, the earliest, and more often in a software implementation project usually the most successful.

- Helps define the way a tool should be used for a given company
- Significantly reduces the learning curve of a product for new administrators
- Keeps environment configurations uniform and scalable
- Adds conformity to an implementation team trying to reach common goals

Why Best Practices?

“The Only Thing That Is Constant Is Change” – Heraclitus

It is important to note that while best practices are to be enforced, they may change over time due to product enhancements, or changes to your business process.

Configuration Naming Best Practices

Configuration Naming

A well thought out naming system configured in Autodesk® PLM 360 will increase efficiency in the following areas:

- Find / Search / Sort on Data
- Write Scripts using Workspace / Field IDs
- Manage the environment over a length of time
- Effectively manage your implementation project and team
- Separate standard App, and Autodesk® PLM 360 content from what you are using in production

Configuration Naming

Workspace Name = Workspace ID

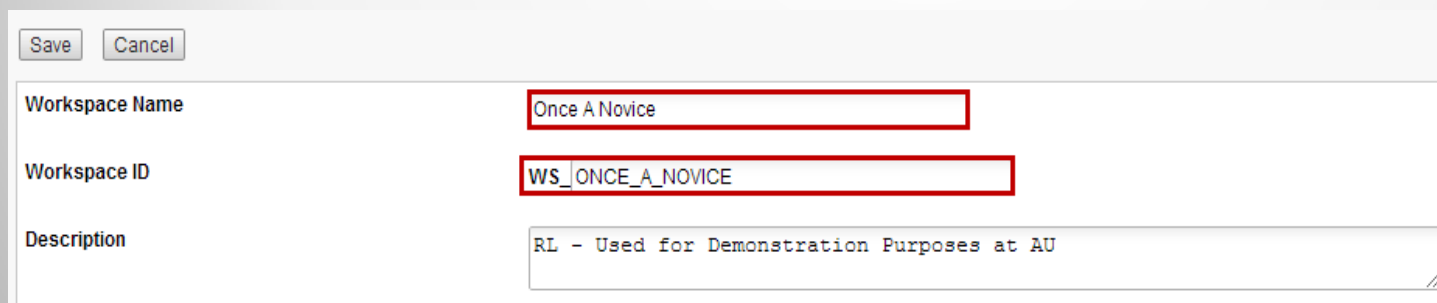

Keep Workspace Names and Workspace IDs Matching

- Use of Computed Fields
- Scripting
- Integration
- API Development

Configuration Naming

Workspace Name = Workspace ID

- Keep Workspace Names and Workspace IDs Matching
- Think ahead and plan for a name that makes sense for your solution
- If a mistake is made use the Clone feature to create a workspace with the correct name

Save Cancel

Workspace Name Once A Novice

Workspace ID WS_ONCE_A_NOVICE

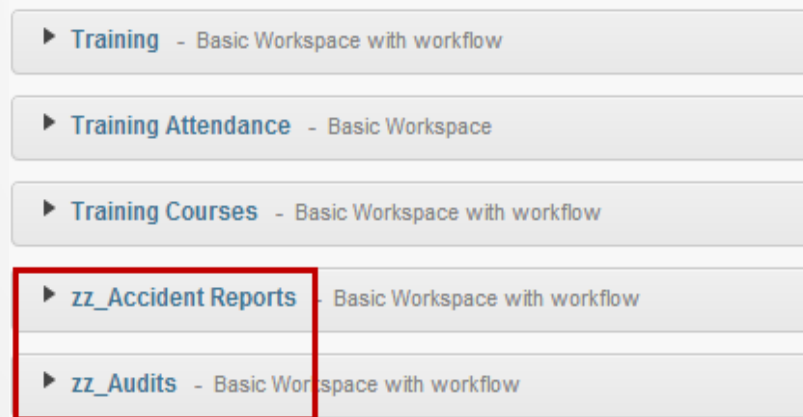

Description RL - Used for Demonstration Purposes at AU

Configuration Naming

Workspace Name = Workspace ID - *Exception to the Rule*

- Autodesk® PLM 360 tenants they come preloaded with valuable applications
- To sort those that are not in Production prefix using “zz_”

Configuration Naming

Field Name = Field ID

- Keep Workspace Fields and Field IDs Matching
- In any Application you could have hundreds of Fields
 - Use of Computed Fields
 - Scripting
 - Integration
 - API Development

Configuration Naming

Field Name = Field ID

- To make things Manageable keep these the same
- If a workspace field is given a name that needs to be changed use the *Clone* Feature to create a new field with the correct name

Field name	<input type="text" value="First Name"/>
Field ID	<input type="text" value="FIRST_NAME"/>

First Name [Single Line Text]	  
-------------------------------	---

Configuration Naming

Create a Unique Identifier

- Autodesk® PLM 360 designates a unique Identifier to each record or item called a dmsID
- Be sure that you designate a unique identifier for your workspace that users can easily identify

autodesklm360.net/workspace#workspaceid=28&dmsid=3313&tab=itemdetails

Descriptor Order	
Descriptor Field 1	Name (NAME)
Descriptor Field 2	Number (NUMBER)
Descriptor Field 3	-- Select --
Descriptor Field 4	-- Select --

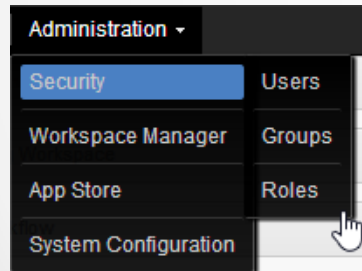

Field ID	NUMBER	Automatically populated using Field Name. You can not edit the ID, and it must be unique to the workspace.
Field description	Enter the description you want to appear next to the field when using or editing an item in this workspace.	
Define a formula to make this a computed field by using other Field IDs from this workspace. For Auto Numbers use your Field ID suffixed with "__AUTO_INC" to reference the underlying counter. Note: Other computed fields cannot be referenced in the formula.		
Computed Field Formula	AUTONUMBER('OAN-', NUMBER__AUTO_INC, 6)	

Let's take a Look!

Configuration Naming

Roles Names

When a workspace is created in Autodesk® PLM 360 it is necessary to create Roles with Permissions to actually grant users' access to use the workspace. An administrator will have the need to create multiple Roles depending on the access that is to be provided to the workspace.

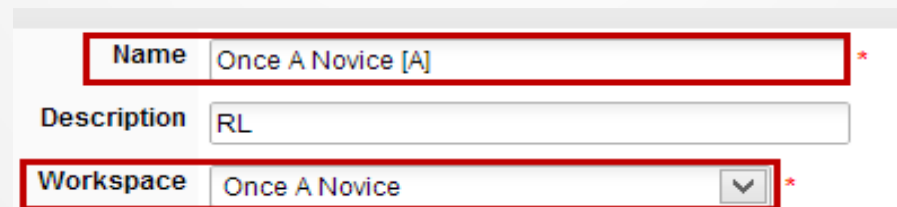

Configuration Naming

Roles Names

Create role names that are:

- Match the workspace they are created for
- Designate the roles purpose
- Are easily applied to Groups

A screenshot of a web form for configuring a role. The form has three main sections: 'Name', 'Description', and 'Workspace'. The 'Name' field contains the text 'Once A Novice [A]' and is highlighted with a red border. The 'Description' field contains the text 'RL'. The 'Workspace' field is a dropdown menu showing 'Once A Novice' and is also highlighted with a red border. Red asterisks are visible to the right of the 'Name' and 'Workspace' fields, indicating they are required.

Name	Once A Novice [A]	*
Description	RL	
Workspace	Once A Novice	*

Configuration Naming

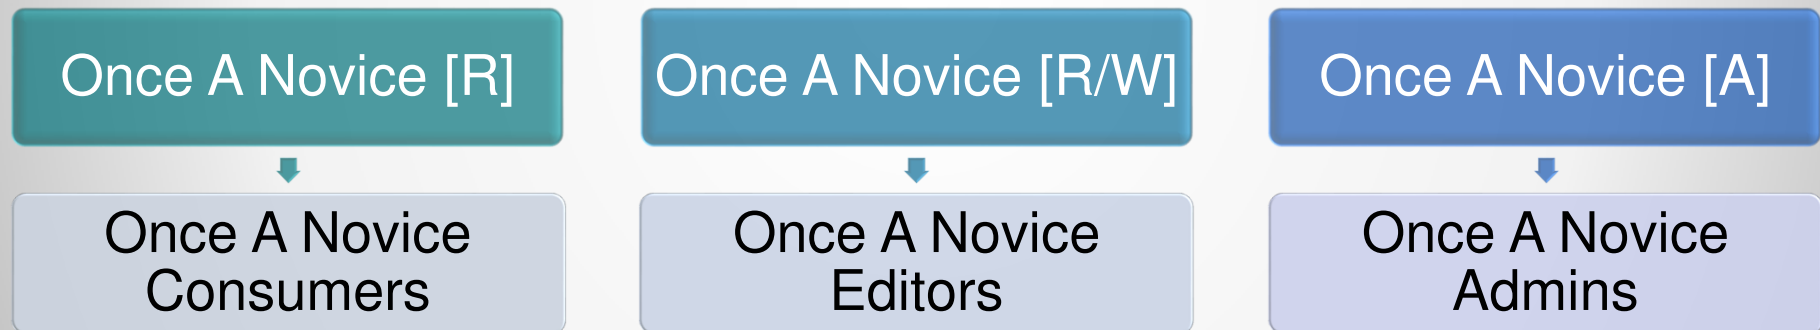

Roles Names

- [R] – Read Only Users (No Edit Capabilities – Consider Participant Licenses)
- [R/W] – Read / Write Users (Add and Edit but limited capability to Delete)
- [A] – Administrative Users – All Access to a given workspace and its capabilities
- [Permission Name – WF] – Workflow related Roles

Configuration Naming

Roles Applied to Groups

- The correctly named Roles are then easily assigned to Groups
- Plan ahead and use Group Names that make sense to your organization

Configuration Naming

Role Description

To easily identify and sort your Roles, use your organization in the description

Role Details

Name

Description

Workspace

Roles	
Name	Description ▾
Now an Expert [A]	AU
Now an Expert [R/W]	AU
Now an Expert [R]	AU
ISO9001 Sections [R]	
Tasks [R/W]	

Let's take a Look!

Configuration Naming

Picklist Naming

Picklists should also have a name that easily identifies its purpose. Some picklists will need further clarification.

- Usually common sense names are adequate enough
- Picklists can be shared amongst many workspaces
- There are a few unique cases where the name should follow a best practice

Configuration Naming

Workspace Picklist Naming

When a pick list is created based on a Workspace it should be prefixed

- [WS] Workspace Name

Picklist Name	<input type="text" value="[WS] Once A Novice"/>	<i>A unique name for this picklist</i>
Picklist ID	<input type="text" value="CUSTOM_LOOKUP_WS_ONCE_A_NOVICE"/>	<i>A unique id used to reference this picklist in custom scripts and formulas.</i>
Picklist Description	<input type="text" value="RL"/>	<i>Description for any additional information or notes about this picklist</i>
Picklist Type	<input type="radio"/> A list of values you define <input checked="" type="radio"/> A list of records from a workspace	<i>Picklists can either be a list of manually entered values or a lookup on another workspace.</i>
Workspace	<input type="text" value="Once A Novice"/>	<i>The source workspace for populating the picklist.</i>
Show Deleted Items	<input type="checkbox"/>	<i>Deleted records will be shown in the picklist marked as [DELETED], both when editing and viewing any fields that use this picklist. If a record is deleted after being selected in this picklist then it will show up as blank in view mode if this option is unchecked.</i>

Configuration Naming

Workspace Picklist Naming

When a filter is applied to a workspace Picklist add a Qualifier

- [WS] Workspace-based picklist {Qualifier}

Picklist Name	<input style="border: 2px solid red;" type="text" value="[WS] Once A Novice {Experts}"/>	<i>A unique name for this picklist</i>
Picklist ID	CUSTOM_LOOKUP_ <input style="border: 1px solid red;" type="text" value="WS_ONCE_A_NOVICE_EXP"/>	<i>A unique id used to reference this picklist in custom scripts and formulas.</i>
Picklist Description	<input type="text" value="RL"/>	<i>Description for any additional information or notes about this picklist</i>
Picklist Type	<input type="radio"/> A list of values you define <input checked="" type="radio"/> A list of records from a workspace	<i>Picklists can either be a list of manually entered values or a lookup on another workspace.</i>
Workspace	<input style="border: 2px solid red;" type="text" value="Once A Novice"/>	<i>The source workspace for populating the picklist.</i>
Show Deleted Items	<input type="checkbox"/>	<i>Deleted records will be shown in the picklist marked as [DELETED], both when editing and viewing any fields that use this picklist. If a record is deleted after being selected in this picklist then it will show up as blank in view mode if this option is unchecked.</i>

Configuration Naming

Picklist Description

To easily identify and sort your Roles, use your organization in the description

Picklist Name	<input type="text" value="[WS] Once A Novice"/>	A unique name for this picklist
Picklist ID	<input type="text" value="CUSTOM_LOOKUP_WS_ONCE_A_NOVICE"/>	A unique id used to reference this picklist in custom scripts and formulas.
Picklist Description	<input type="text" value="RL"/>	Description for any additional information or notes about this picklist
Picklist Type	<input type="radio"/> A list of values you define <input checked="" type="radio"/> A list of records from a workspace	Picklists can either be a list of manually entered values or a lookup on another workspace.
Workspace	<input type="text" value="Once A Novice"/>	The source workspace for populating the picklist.
Show Deleted Items	<input type="checkbox"/>	Deleted records will be shown in the picklist marked as [DELETED], both when editing and viewing any fields that use this picklist. If a record is deleted after being selected in this picklist then it will show up as blank in view mode if this option is unchecked.

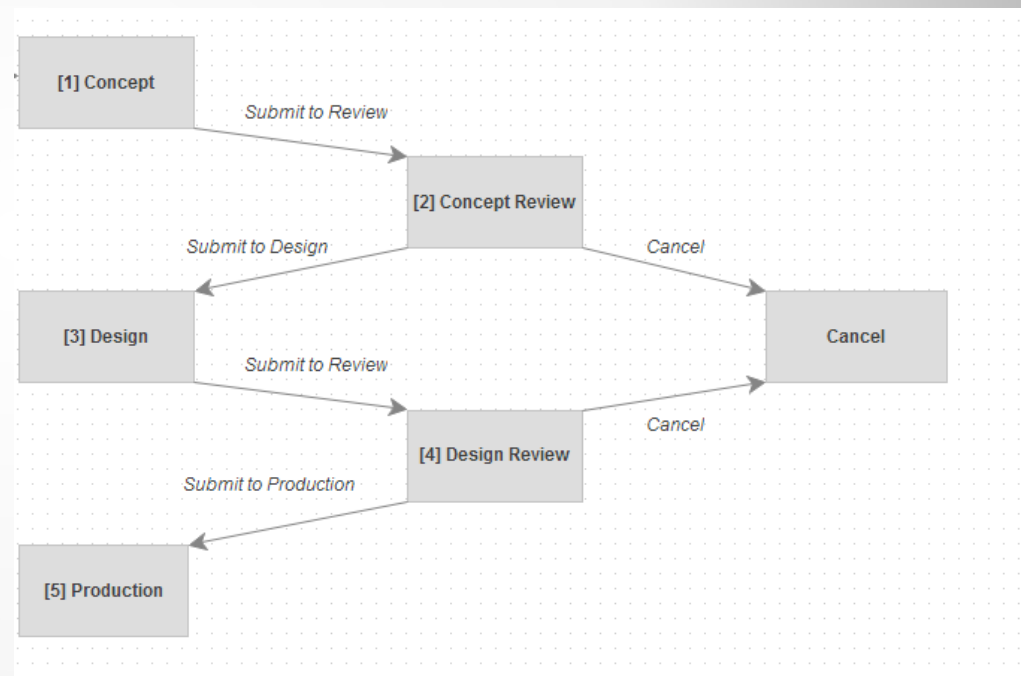

Let's take a Look!

Workflow Best Practices

Workflow Best Practices

When creating a workflow in Autodesk® PLM 360 there are a number of best practices that should be considered

- Naming Permissions
- Simple Creation of Permissions
- Correctly Assigning Permissions To Roles, and Groups
- Consider use with Milestones

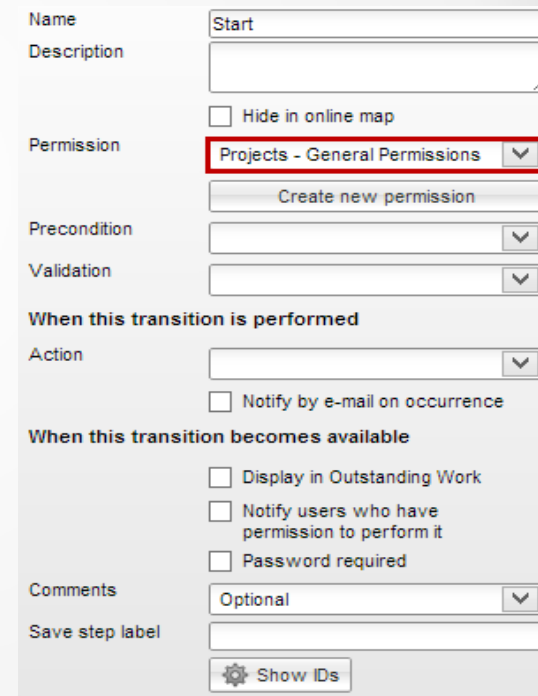

Workflow Best Practices

Workflow Permissions

When naming Permissions use the Workspace Name or acronym to which it applies and the general purpose of the permission

- Projects – General Permissions
- Projects – Cancel Permissions

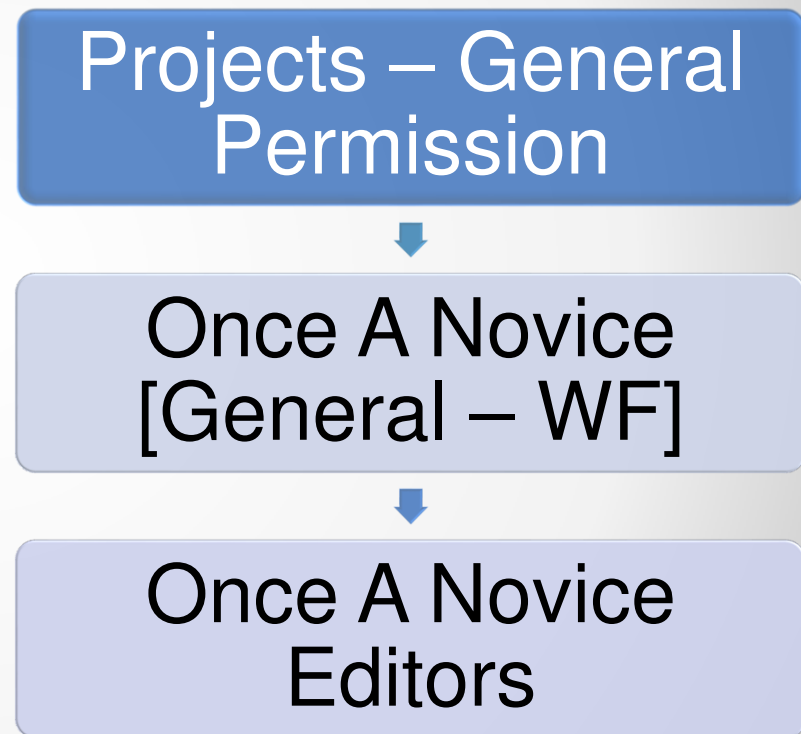

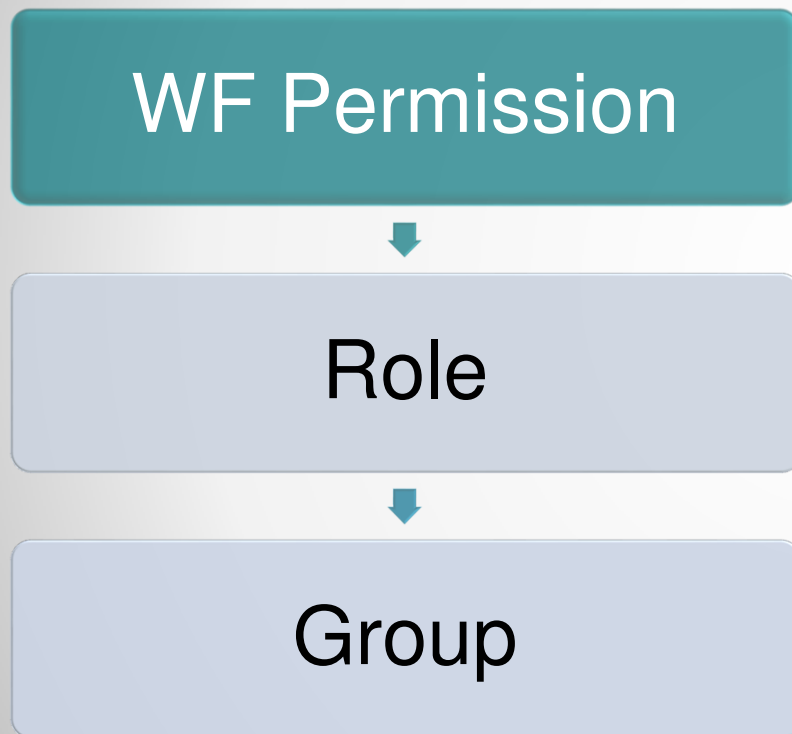

The screenshot shows a configuration window for a workflow permission. The 'Name' field is set to 'Start'. The 'Description' field is empty. There is a checkbox for 'Hide in online map'. The 'Permission' dropdown menu is open, showing 'Projects - General Permissions' selected and highlighted with a red border. Below this is a 'Create new permission' button. The 'Precondition' and 'Validation' dropdowns are also empty. Under the section 'When this transition is performed', there is an 'Action' dropdown and a checkbox for 'Notify by e-mail on occurrence'. Under the section 'When this transition becomes available', there are three checkboxes: 'Display in Outstanding Work', 'Notify users who have permission to perform it', and 'Password required'. The 'Comments' dropdown is set to 'Optional'. The 'Save step label' field is empty. At the bottom, there is a 'Show IDs' button with a gear icon.

Workflow Best Practices

Workflow Permissions Applied

Workflow Best Practices

Workflow Permission Creation – Keep it Simple

When creating a workflow it is possible to generate many different permissions, even on per transition. Plan ahead and keep it Simple

- Create a General Permissions permission
- Use this through your early testing and development
- Consider Validation scripting to block transitions that have requirements to be filled
 - Fields Required, Approvals, Tasks Management

Workflow Best Practices

Workflow Permission Creation – Keep it Simple

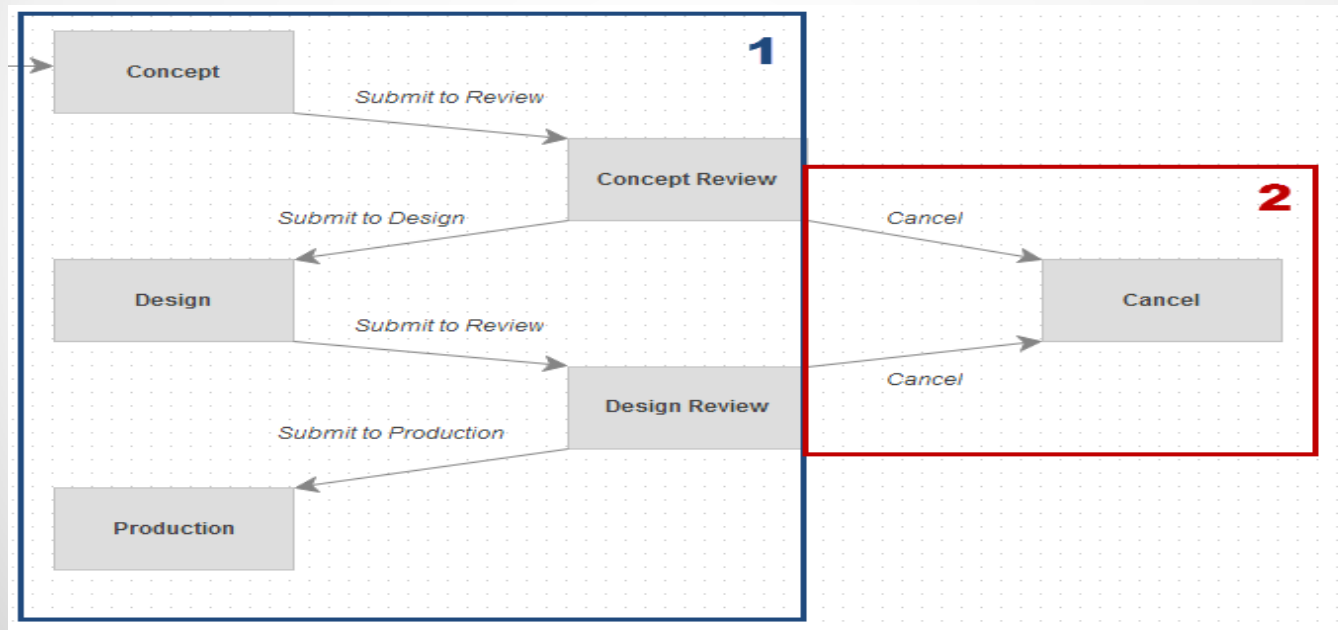

Go back and carefully evaluate where additional workflow permissions are required

- Migration Workflows
- Restricting or Giving groups of People Reject / Cancel Permissions
- Block Hidden Transitions and Workflow states from Workflow Actions

Workflow Best Practices

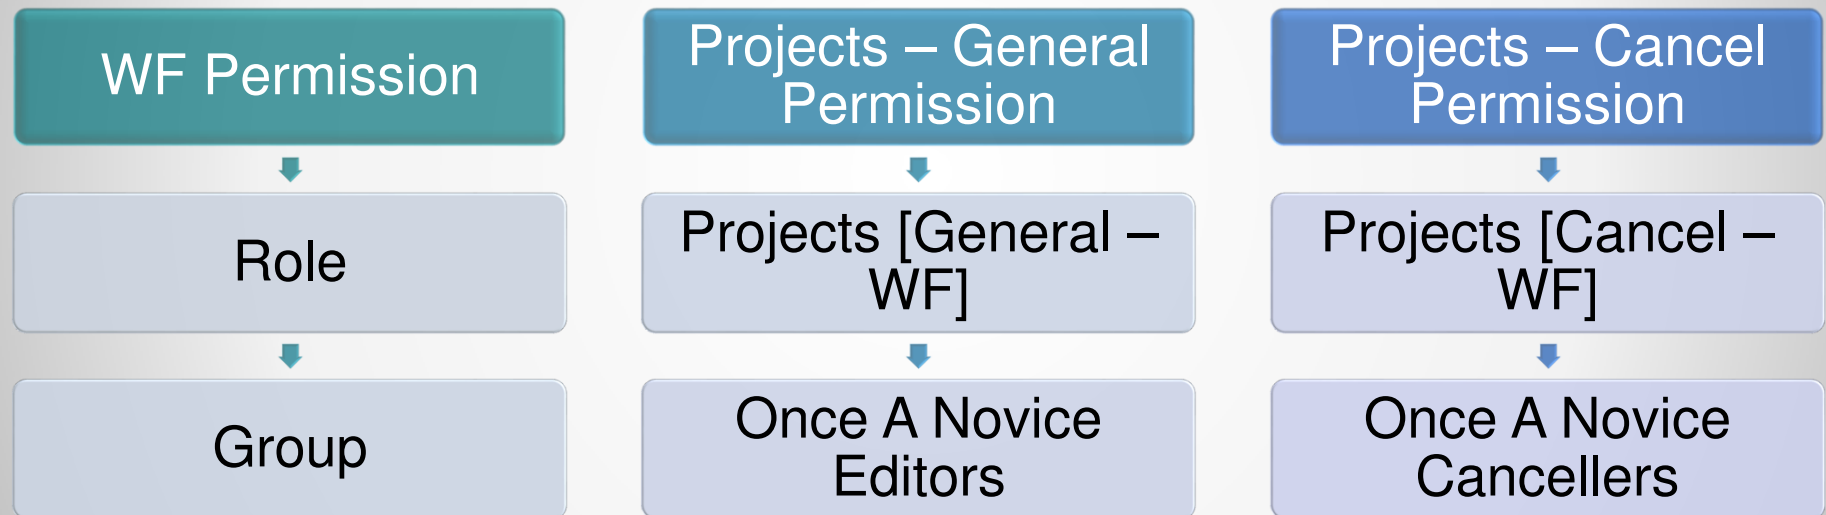

Workflow Permission Creation – Keep it Simple

1. General Permissions Applied
2. Cancel Permissions Applied

Workflow Best Practices

Assigning Permissions to a dedicated Role

Workflow Best Practices

Assigning Permissions to a dedicated Role

Assign each workflow permission to its own role separate of other roles (R/W, R, A) for each workspace.

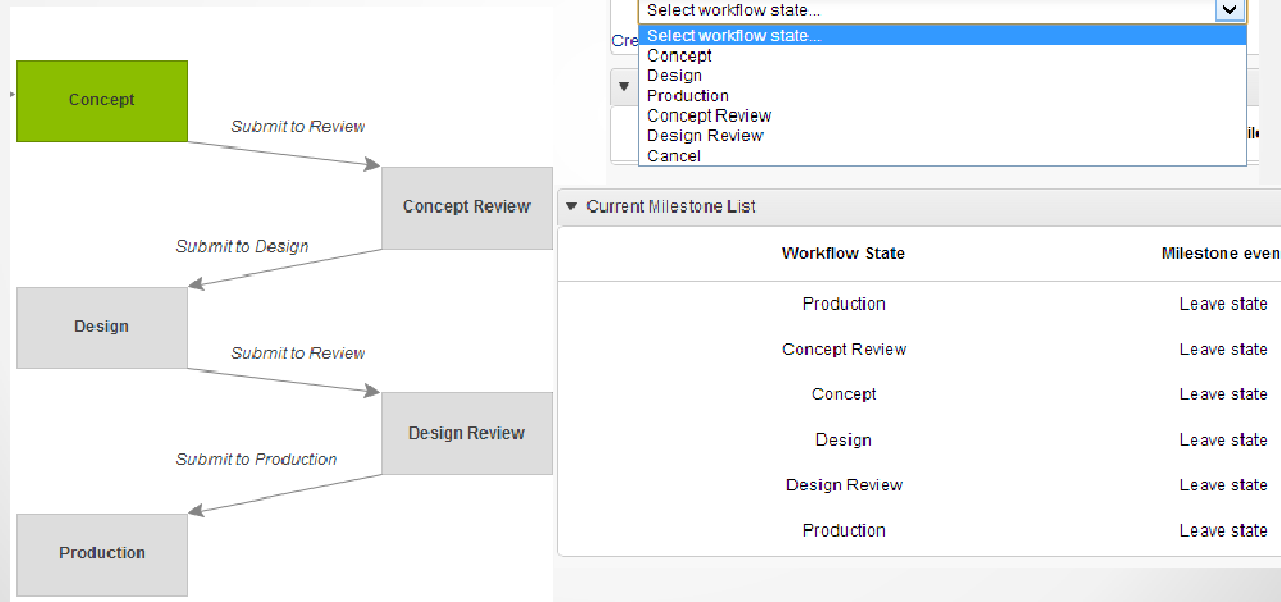

- This greatly simplifies
 - Telling where workflow permissions are used
 - Understand what groups have which permissions in a workflow
- Remember a User with out the correct Workflow permissions Can not
 - Promote an Item
 - Add Grid Rows
 - Add Attachments
 - Modify Item Details

Let's take a Look!

Workflow Best Practices

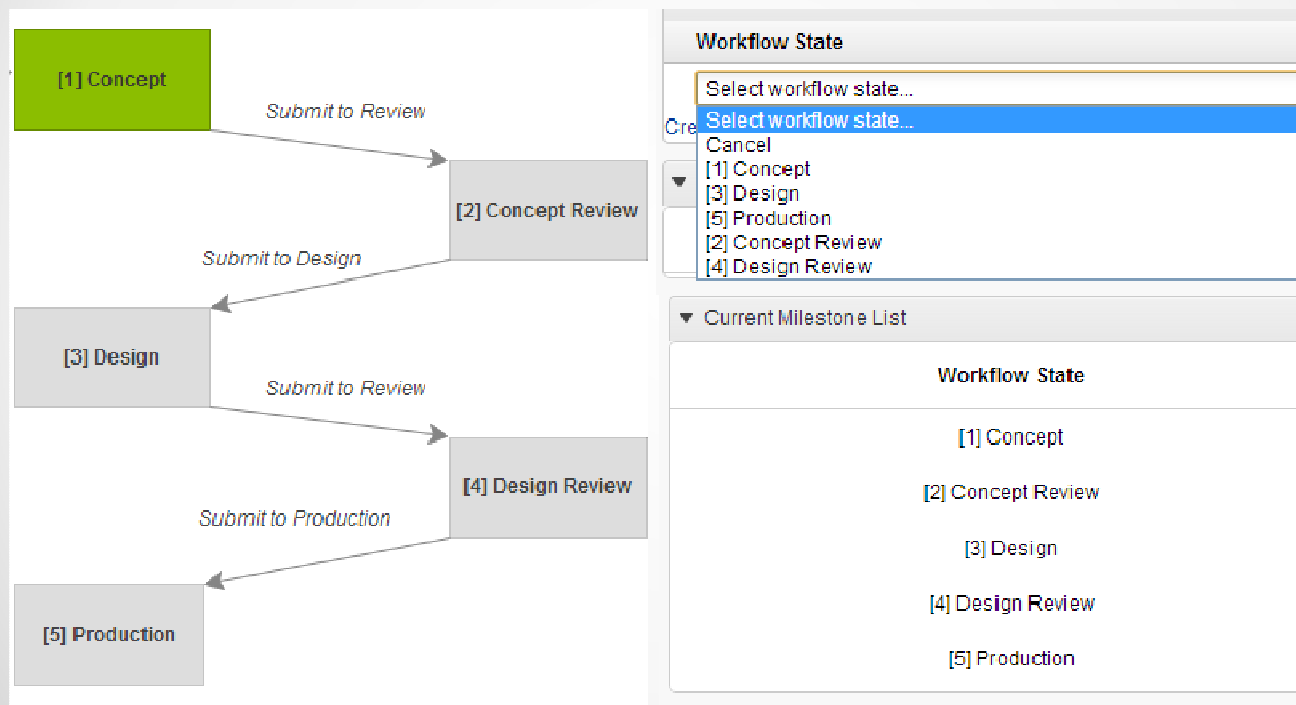

Using Numbers in your Workflow (Milestone Related)

When creating a workflow that will be used with Milestones it is important to know the order in which the workflow states are going to be reached.

Workflow Best Practices

Using Numbers in your Workflow (Milestone Related)

Let's take a Look!

General Scripting Best Practices

Scripting Best Practices

A little scripting experience can go a long way when building custom solutions in Autodesk® PLM 360. As with normal configuration there are a number of Best Practices to consider

- Script Naming
- Script Headers and Revision (Title Blocks for your scripts)
- Commenting Scripts Effectively
- Using and Managing Library Scripts

Scripting Best Practices

Script Naming

As administrators and developers generate scripts they need to easily be able to identify what scripts are for.

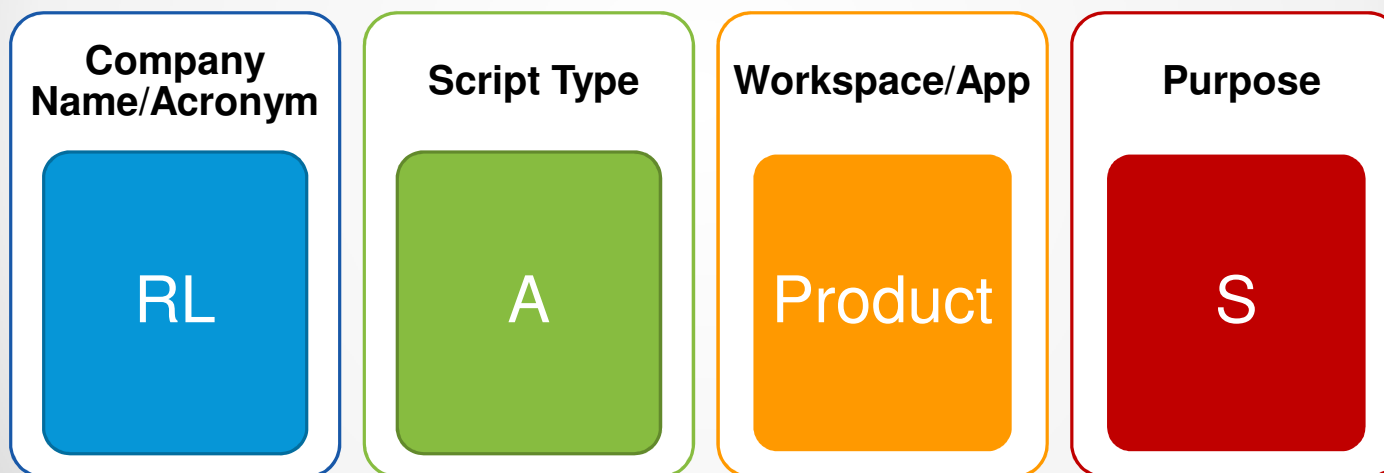

Consider the following needs:

- Distinguish Scripts that are in Production Use from the OOTC solutions
- Effectively Manage Scripts between Autodesk® PLM 360 and another program used for script development

Scripting Best Practices

Script Naming

RL_A_Product_S

Scripting Best Practices

Script Naming

Script Type Acronyms

- A = Action
- V = Validation
- C = Condition
- L = Library

Purpose Type Acronyms

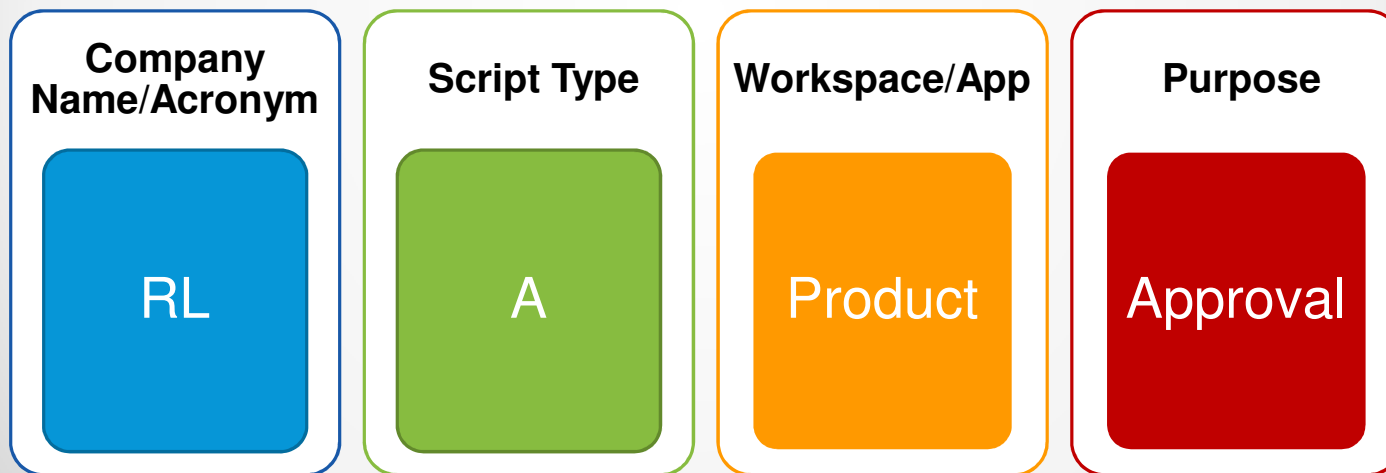

- S = Spawning
- CG = Copy Grid
- MS = Milestone Creation
- PM = Project Management
- AT = Auto Transition

Scripting Best Practices

Script Naming

When a Script is written and does not fall into a purpose type, a short name is assigned to that section of the name.

RL_A_Product_Approval

Scripting Best Practices

Script Naming – Library

RL_L_SpawnItemAddtoPicklist

**Company
Name/Acronym**

RL

Script Type

L

Function

SpawnItemAddtoPicklist

Scripting Best Practices

Script Headers and Revision (Title Block for Your Scripts)

A script Header contains important, highly useful information that can be used to the Scripts:

- Name
- Purpose
- Constraints
- Import
- Author / Revision Author
- Change History
- Portability if created or managed in another program

Scripting Best Practices

Script Headers and Revision (Title Block for Your Scripts)

```
/******
```

Name: RL_A_Product_S

Description:

This script was designed to Spawn all necessary documents required for a Product

Imports:

RL_L_SpawnItemAddtoPicklist

Constraints:

Fields:

Documents: Associated Product

Products: Spawned Document Fields; Fields must use a linking Picklist [WS] Documents

Revisions:

Date	Modified By	Company	Description of Change
=====	=====	=====	=====
2013-12-5	RAC	Razorleaf	Initial Creation

```
*****/
```

Scripting Best Practices

Script Commenting

Commenting scripts with notes as you build your scripts is important, although it can be a tedious practice, and takes a little extra time, below are some common reasons this is important:

- Revisiting a script for further development after a long period of time has passed
- Developing scripts in a group of administrators
- Further developing scripts created by others

Scripting Best Practices

Script Commenting & Variables

Create your variable names with care, and although commenting is good don't overdo it.

```
//Establish template variables

var templateItem = loadItem(505);
var headerText = templateItem.HEADER_TEMPLATE;
var bodyText = templateItem.BODY_TEMPLATE;
var tableHeaderText = templateItem.TABLE_HEADER_TEMPLATE;
var rowText = templateItem.ROW_TEMPLATE;
var altRowText = templateItem.ALTERNATING_ROW_TEMPLATE;
var footerText = templateItem.FOOTER_TEMPLATE;
var tableseparator = templateItem.TABLESEPARATOR;
var pageFooter = templateItem.PAGEFOOTER_TEMPLATE;
```

```
//build the report:
htmlOutput = headerText;
htmlOutput += bodyText;

//Build the table header:
var outHeaderText = tableHeaderText;
tableHeaderText = tableHeaderText.replace("@@item@", cleanText(item.TEST_ID));

htmlOutput += tableHeaderText;

//loop the grid and build the report
for (var i in gridItems)
{
    var outRowText = rowText           //get the template text
    var gridRowVal = gridItems[i];    //get the row

    if (!isEven(i))
    {
        outRowText = altRowText;      //switch to alternate row if applicable
    }

    var newDate = getFormattedDate(gridRowVal.DATE_LOGGED);
    outRowText = outRowText.replace("@@date@", newDate);
    outRowText = outRowText.replace("@@name@", cleanText(gridRowVal.NAME));
    outRowText = outRowText.replace("@@description@", cleanText(gridRowVal.DESRIPTION));
}
```

Scripting Best Practices

Library Scripts - Functions

Library scripts contain functions that are then used in Action, Condition, and Validation scripts. Using library scripts for commonly used functions greatly reduces repetitive scripting, consolidates scripting efforts, and creates consistency across a development team

- RL_L_addDaysToDate

```
function addDaysToDate (startDate, daysToAdd) {  
  var futureDate = new Date();  
  var dayOfMonth = startDate.getDate();  
  futureDate.setDate(dayOfMonth+daysToAdd);  
  return futureDate;  
}
```

**Find other Useful Functions
in your Handout**

Scripting Best Practices

Library Scripts Separation

- Avoid the urge to compile many functions into a common library.
- It greatly simplifies the management of the scripts, and aids troubleshooting efforts.

Scripting Best Practices

Library Script General Practice

- **Plan ahead and understand your entire solution before sitting down to automate**

Implementation Best Practices

Implementation Best Practices

General Implementation Best Practices

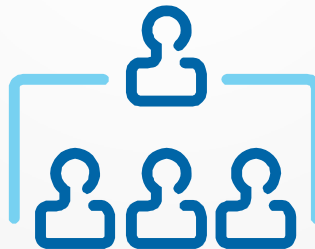

Remember your implementation is about more than just the picks and Clicks!

- People, Process, Technology
- Map it, Build it, Use it (Sounds Simple Right)
- PLM for your PLM

Implementation Best Practices

People Process Technology

- People:
 - Who understands the process?
 - Who would give constructive feedback during early testing?
 - Who will be the PLM Champion(s)

Implementation Best Practices

People Process Technology

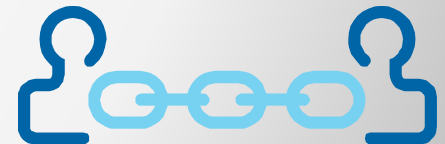

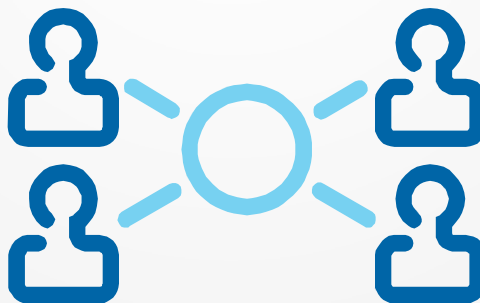

- People:
 - Build the right Team
 - Facilitate Constructive Meetings
 - Build Champions
 - Get people talking

Implementation Best Practices

People Process Technology

- Process:
 - What is the current process?
 - Is the process already documented?
 - What is good about the current process?
 - What is broken in the current process?

Implementation Best Practices

People Process Technology

- Technology:
 - Know the technology you're implementing
 - Consider the impact of new technology on old technology
 - Even the best tools, and thorough process cannot guarantee success without the right people.

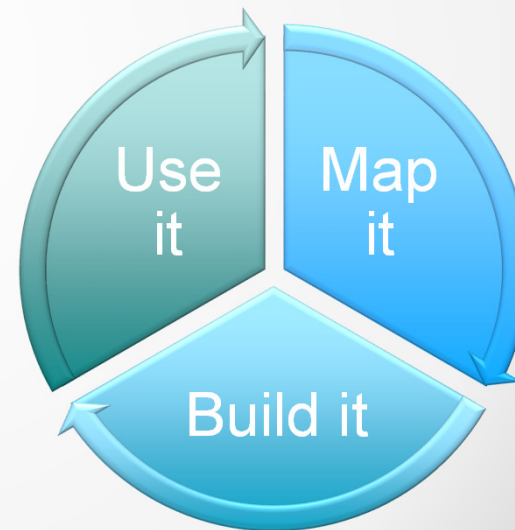

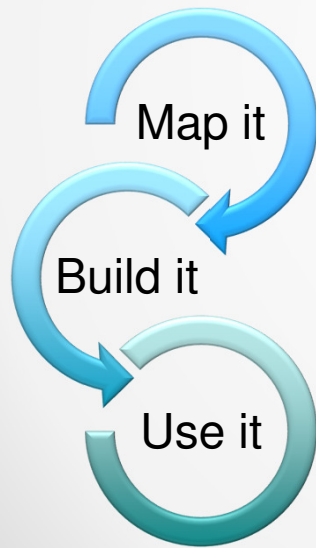

Implementation Best Practices

Map it, Build it, Use it

Think:

- Iterative Development
- Rinse and Repeat

Implementation Best Practices

PLM for your PLM

Our PLM projects often have the same project and process management needs as the solutions we are developing inside Autodesk® PLM 360.

- A great way to get more familiar with the tool
- Support your implementation efforts
- Project Management, Training, Configuration Management
